BENZYL MORPHOLINE DERIVATIVES

This invention relates to novel benzyl morpholine compounds, and to their use in inhibiting serotonin and norepinephrine reuptake.

5   Serotonin has been implicated in the aetiology of many disease states and has been found to be of importance in mental illnesses, depression, anxiety, schizophrenia, eating disorders, obsessive compulsive disorder (OCD) and migraine. Indeed many currently used treatments of these disorders are thought to act by modulating serotonergic tone. During the last decade, multiple serotonin receptor subtypes have been

10   characterised. This has led to the realisation that many treatments act *via* the serotonergic system, such as selective serotonin reuptake inhibitor (SSRI) antidepressants which increase serotonin transmission, for example, the hydrochloride salt of fluoxetine.

Drugs that exert their main action on the norepinephrinergic system have been available for some time, however their lack of selectivity has made it difficult to

15   determine specific clinical effects produced by a selective action on norepinephrine reuptake. Accumulating evidence indicates that the norepinephrinergic system modulates drive and energy, whereas the serotonergic system modulates mood. Thus norepinephrine appears to play an important role in the disturbances of vegetative function associated with affective, anxiety and cognitive disorders. Atomoxetine hydrochloride is a selective

20   inhibitor of norepinephrine reuptake, and is marketed for the treatment of attention deficit hyperactivity disorder (ADHD). Reboxetine is also a selective norepinephrine reuptake inhibitor and is marketed for the treatment of depression. WO99/15177 discloses the use of Reboxetine to treat ADHD and WO01/01973 discloses the use of S,S-Reboxetine to treat ADHD.

25   Norepinephrine and serotonin receptors are known to interact anatomically and pharmacologically. Compounds that affect only serotonin have been shown to exhibit modulatory effects on norepinephrine, pointing toward an important relationship between the two neurotransmitter systems.

Duloxetine, (+)-*N*-methyl-3-(1-naphthalenyloxy)-2-thiophenepropanamine

30   hydrochloride, inhibits the reuptake of both norepinephrine and serotonin, and is currently under development for the treatment of depression and urinary incontinence. The compound duloxetine was disclosed in US Patents 5,023,269 and 4,956,388.

-2-

According to the present invention there is provided a compound of formula (I)
(I)

wherein

5   R is H;

Ar is an aromatic group selected from phenyl; X is a phenyl group; R' is H or C_1-C_4 alkyl; and each R_1 is independently H or C_1-C_4 alkyl; and pharmaceutically acceptable salts thereof.

The aromatic group Ar may be substituted or unsubstituted phenyl. For example,

10   Ar may be unsubstituted phenyl or, preferably, phenyl substituted with 1, 2, 3, 4 or 5 substitutents, preferably with 1 or 2, for example 1, substituent. The substituted phenyl group is preferably substituted in the 2-position. Suitable substitutents include C_1-C_4 alkyl, $O(C_1$-C_4 alkyl), $S(C_1$-C_4 alkyl), halo, and phenyl, optionally substituted with, for example, halo, C_1-C_4 alkyl or $O(C_1$-C_4 alkyl).

15   The group X may be substituted or unsubstituted phenyl. For example, X may be phenyl substituted with 1, 2, 3, 4 or 5 substituents, preferably with 1 substituent. Suitable substituents include C_1-C_4 alkyl, $O(C_1$-C_4 alkyl), and halo.

"C_1-C_4 alkyl" as used herein includes straight and branched chain alkyl groups of 1, 2, 3 or 4 carbon atoms, and may be unsubstituted or substituted. C_1-C_2 alkyl groups

20   are preferred. Suitable substituents include halo. Thus the term "C_1-C_4 alkyl" includes haloalkyl. Similar terms defining different numbers of C atoms (e.g. "C_1-C_2 alkyl") take an analogous meaning. When R' is C_1-C_4 alkyl it is preferably unsubstituted. When R^1 is C_1-C_4 alkyl it is preferably unsubstituted.

"Halo" includes F, Cl, Br and I, and is preferably F or Cl.

-3-

For the compounds of formula (I) above, R' is preferably H or Me. More preferably R' is H.

For the compounds of formula (I) above, each R^1 is preferably H or Me with 0, 1, 2 or 3 of R^1 being Me. More preferably only 1 R^1 is Me. Most preferably all R^1 are H.

5   For the compounds of formula (I) above, it is preferred that R' and all R^1 are H.

Particularly preferred substituents for the Ar group include trifluoromethyl and methoxy.

A preferred group of compounds according to the present invention is represented by formula (II);

(II)
in which R_2 and R_3 are each independently selected from H, C_1-C_4 alkyl, O(C_1-C_4 alkyl), S(C_1-C_4 alkyl), halo, and phenyl; and

R_4 is selected from H, C_1-C_4 alkyl, and O(C_1-C_4 alkyl) and halo; and pharmaceutically

15   acceptable salts thereof.

R_2 is preferably C_1-C_2 alkyl, O(C_1-C_2 alkyl), S(C_1-C_2 alkyl), Cl or F. R_3 is preferably H, Me or Cl. R_4 is preferably H, C_1-C_2 alkyl, O(C_1-C_2 alkyl), Cl or F.

The compounds of the present invention are dual reuptake inhibitors of serotonin and norepinephrine. Biogenic amine transporters control the amount of biogenic amine

20   neurotransmitters in the synaptic cleft. Inhibition of the respective transporter leads to a rise in the concentration of that neurotransmitter within the synaptic cleft. Compounds of Formula (I) and their pharmaceutically acceptable salts preferably exhibit a K_i value less than 100nM at the norepinephrine transporter and a K_i value less than 100nM at the serotonin transporter as determined using the scintillation proximity assays as described

25   below. More preferred compounds of Formula (I) and their pharmaceutically acceptable

-4-

salts exhibit a K_i value less than 50nM at the norepinephrine transporter and a K_i value less than 50nM at the serotonin transporter. Especially preferred compounds of Formula (I) and their pharmaceutically acceptable salts exhibit a K_i value less than 20nM at the norepinephrine transporter and a K_i value less than 20nM at the serotonin transporter.

5   Preferably, compounds of the present invention selectively inhibit the norepinephrine and serotonin transporters relative to the dopamine transporter by a factor of at least five, more preferably by a factor of at least ten. Advantageously, they have a reduced interaction (both as substrate and inhibitor) with the liver enzyme Cytochrome P450 (CYP2D6). That is to say, they preferably exhibit less than 75% metabolism via the

10   CYP2D6 pathway according to the CYP2D6 substrate assay described below and they preferably exhibit an IC50 of >6μM according to the CYP2D6 inhibitor assay described below. They are particularly useful for the treatment of disorders associated with serotonin and norepinephrine dysfunction in mammals, such as CNS disorders including depression, persistant pain and stress urinary incontinence.

15   The term "serotonin and norepinephrine dysfunction" as used herein refers to a reduction in the amount of serotonin and norepinephrine neurotransmitter within the synaptic cleft below that which would be considered to be normal. Thus the phrase "disorders associated with serotonin and norepinephrine dysfunction in mammals" refers to disorders which are associated with a reduction in the amount of serotonin and

20   norepinephrine neurotransmitter within the synaptic cleft below that which would be considered to be normal for the mammalian species in question. Some examples of disorders currently believed to be associated with reduced levels of serotonin and norepinephrine within the synaptic cleft are detailed below.

        The compounds of the present invention are also indicated for the treatment of

25   disorders which are ameliorated by an increase in the amount of serotonin and norepinephrine neurotransmitter within the synaptic cleft of a mammal above that which would be considered to be normal for the mammalian species in question.

        The term "treatment" as used herein refers to both curative and prophylactic treatment of disorders associated with serotonin and norepinephrine dysfunction.

30   Compounds of the present invention may be prepared by reacting a compound of the formula (III):
-5-
(III)

where R5 is a protecting group, e.g. benzyl, X, R' and R^1 are as formula I above and Y is a leaving group, with an aryl thiol. Examples of suitable leaving groups include halo and mesylate, but the nature of the leaving group is not critical.

Compounds of the present invention may also be prepared by deprotecting a compound of the formula (IV):

(IV)

where R_5 is a protecting group, e.g. benzyl, and Ar, X, R' and R^1 are as defined in formula (I) above to provide a compound of formula (I), optionally followed by the step of forming a pharmaceutically acceptable salt.

Suitable N-protecting groups will be known to the person skilled in the art as will methods for their removal. Further information on suitable deprotecting groups is contained in the well known text "Protective Groups in Organic Synthesis", Theodora W. Greene and Peter G.M. Wuts, John Wiley & Sons, Inc., New York, 1999, pp.494-653. Preferred N-protecting groups include benzyl, allyl, carbamates such as benzyloxycarbonyl (cbz) and t-butyloxycarbonyl (boc) and amides.

Compounds of the present invention may be prepared by conventional organic chemistry techniques from N-benzyl-cyanomorpholine 1 (Route A) or N-benzyl-morpholinone 2 (Route B) as outlined in Scheme 1 below. For clarity, X is shown as
-6-

phenyl and R' and R¹ are shown as H. It will be appreciated that analogous methods could

be applied for other possible identities of X, R' and R¹.
Scheme 1

5   More detail of Route A is given in Scheme 2:

Scheme 2

The amino alcohol can be obtained by reaction of N-benzyl-cyanomorpholine
with a Grignard reagent, followed by acid hydrolysis to give racemic phenyl ketone
10   which may be separated on chiral HPLC. (2R)-Phenyl ketone may then be reduced with
DIP-Cl to give the amino alcohol in high diastereomeric excess. The amino alcohol may
be converted into the benzyl bromide to give the desired N-substituted aryl thio
morpholines after displacement with the requisite aryl thiol. Deprotection of the tertiary
amine gives the final products. Deprotection may be achieved by reaction with α-

−7−

chloroethyl chloroformate as described in the specific examples. Deprotection may also be achieved by reaction with phenylchloroformate followed by quenching of the generated benzyl chloride with dimethylamine prior to isolation of the phenylcarbamate intermediate which is then hydrolysed in isopropanol in the presence of 30% NaOH.

5   Detail of route B is given in Scheme 3:

Scheme 3

Treatment of *N*-benzyl morpholinone with a strong base such as lithium diisopropylamide at low temperature followed by addition of benzaldehyde gives aldol
10   adducts as a 2:1 mixture of diastereomer pairs, which may be separated using conventional chromatographic techniques. Reduction with a borane reagent at elevated temperatures gives diasteremeric amino alcohol pairs.

Amino alcohol pair (2S,2'S) and (2R,2'R) may be converted to bromide and further to racemic aryl thio morpholines as outlined in Scheme 4. Amino alcohol pair
15   (2R,2'S) and (2S,2'R) may be converted into the corresponding mesylate. Displacement with the requisite thiol, followed by removal of the nitrogen protecting group furnishes aryl thiol morpholines as racemic mixtures of two diastereomers. The racemic aryl thiol morpholines may be separated into enantiomerically pure products using chiral HPLC technology.

-8-
Scheme 4

Compounds of the present invention are selective inhibitors of the reuptake of both serotonin and norepinephrine and as such are useful as pharmaceuticals. They may be indicated in the treatment of disorders associated with serotonin and norepinephrine dysfunction in mammals, including depression, eating disorders (including bulimia and anorexia nervosa), inflammatory bowel disorders, functional bowel disorders, dyspepsia, chron's disease, iletis, ischemic bowel disease, ulcerative colitis, gastroesophageal reflux for functional bowel disorders, irritable bowel syndrome, obesity, insterstitial cystitis, urethral syndrome, gastric motility disorders, substance abuse (including alcoholism, tobacco abuse, symptoms caused by withdrawal or partial withdrawal from the use of tobacco or nicotine and drug addiction including cocaine abuse) , smoking cessation, pain (including inflammatory pain, neuropathic pain, non-neuropathic non-inflammatory pain, persistent pain, persistent pain of inflammatory and/or neuropathic origin, headache and migraine), urinary incontinence (including stress urinary incontinence and urge incontinence), dementia of ageing, senile dementia, Alzheimer's, memory loss, Parkinsonism, attention-deficit disorder (including attention-deficit hyperactivity disorder), anxiety, social phobia, disruptive behavior disorders, conduct disorders, impulsive control disorders, borderline personality disorder, chronic fatigue syndrome, panic disorders, obsessive compulsive disorder, post-traumatic stress disorder, schizophrenia, gastrointestinal disorders, cardiovascular disorders, emesis, sleep disorders, cognitive disorders, psychotic disorders, brain trauma, premenstrual syndrome or late luteal syndrome, sexual dysfunction (including premature ejaculation and erectile difficulty), autism, mutism and trichotilomania. The compounds of the present invention are particularly suitable for the treatment of pain.

-9-

For clinical purposes, pain may be divided into two categories: acute pain and persistent pain. Acute pain is provoked by noxious stimulation produced by injury and/or disease of skin, deep somatic structures or viscera, or abnormal function of muscle or viscera that does not produce actual tissue damage. On the other hand, persistent pain can

5   be defined as pain that persists beyond the usual course of an acute disease or a reasonable time for an injury to heal or that is associated with a chronic pathologic process that causes continuous pain or the pain recurs at intervals for months or years. If pain is still present after a cure should have been achieved, it is considered persistent pain. For the purpose of the present invention, persistent pain can be chronic non-

10   remitting or recurrent. The difference in definition between acute and persistent pain is not merely semantic but has an important clinical relevance. For example, a simple fracture of the wrist usually remains painful for a week to 10 days. If the pain is still present beyond the typical course of treatment, it is likely that the patient is developing reflex sympathetic dystrophy, a persistent pain syndrome that requires immediate

15   effective therapy. Early and effective intervention potentially prevents the undue disability and suffering, and avoids the potential development of a condition that becomes refractory to therapy.

Acute and chronic pain differ in etiology, mechanisms, pathophysiology, symptomatology, diagnosis, therapy, and physiological responses. In contrast to the

20   transitory nature of acute pain, persistent pain is caused by chronic pathologic processes in somatic structures or viscera, by prolonged and sometimes permanent dysfunction of the peripheral or central nervous system, or both. Also, persistent pain can sometimes be attributed to psychologic mechanisms and/or environmental factors.

Current therapies for persistent pain include opiates, barbiturate-like drugs such as

25   thiopental sodium and surgical procedures such as neurectomy, rhizotomy, cordotomy, and cordectomy.

References herein to pain are intended to refer to persistent pain.

The present invention provides pharmaceutical compositions comprising a compound of formula I or formula II or a pharmaceutically acceptable salt thereof,

30   together with a pharmaceutically acceptable diluent or carrier.

Further, the present invention provides a compound of formula I or a pharmaceutically acceptable salt thereof, for use as a pharmaceutical; and a compound of

formula I or a pharmaceutically acceptable salt thereof, for use as a selective inhibitor of the reuptake of both serotonin and norepinephrine. Preferably such selective inhibition occurs within mammalian cells (including mammalian cell membrane preparations), especially those found within the central and/or peripheral nervous system. More preferably such selective inhibition occurs within the cells of the central nervous system of a mammal, especially a human, in need thereof.

The present invention also provides the use of a compound of formula I or formula II, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for selectively inhibiting the reuptake of serotonin and norepinephrine; the use of a compound of formula I or formula II, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment of disorders associated with serotonin and norepinephrine dysfunction in mammals; the use of a compound of formula I or formula II, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment of a disorder selected from depression, OCD, anxiety, memory loss, urinary incontinence, conduct disorders, ADHD, obesity, alcoholism, smoking cessation and pain; and the use of a compound of formula I or formula II, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment of a disorder selected from depression, stress urinary incontinence, and persistent pain. The present invention further provides a compound of formula I or formula II for treating disorders associated with serotonin and norepinephrine dysfunction in mammals, for example a disorder selected from depression, OCD, anxiety, memory loss, urinary incontinence, conduct disorders, ADHD, obesity, alcoholism, smoking cessation and pain, especially depression, stress urinary incontinence, and persistent pain.

Further the present invention provides a method for selectively inhibiting the reuptake of serotonin and norepinephrine in mammals, comprising administering to a patient in need thereof an effective amount of a compound of formula I or formula II or a pharmaceutically acceptable salt thereof; a method for treating disorders associated with serotonin and norepinephrine dysfunction in mammals, comprising administering to a patient in need thereof an effective amount of a compound of formula I or formula II or a pharmaceutically acceptable salt thereof; and a method for treating a disorder selected from depression, OCD, anxiety, memory loss, urinary incontinence, conduct disorders, ADHD, obesity, alcoholism, smoking cessation and pain, especially depression, stress

-11-

urinary incontinence or persistant pain, comprising administering to a patient in need thereof an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof.

5   The present invention includes the pharmaceutically acceptable salts of the compounds of formula I and formula II. Suitable salts include acid addition salts, including salts formed with inorganic acids, for example hydrochloric, hydrobromic, nitric, sulphuric or phosphoric acids, or with organic acids, such as organic carboxylic or organic sulphonic acids, for example, acetoxybenzoic, citric, glycolic, o- mandelic-l, mandelic-dl, mandelic d, maleic, mesotartaric monohydrate, hydroxymaleic, fumaric,

10   lactobionic, malic, methanesulphonic, napsylic, naphthalenedisulfonic, naphtoic, oxalic, palmitic, phenylacetic, propionic, pyridyl hydroxy pyruvic, salicylic, stearic, succinic, sulfanilic, tartaric, 2-hydroxyethane sulphonic, toluene-p-sulphonic, and xinafoic acids.

In addition to the pharmaceutically acceptable salts, other salts are included in the invention. They may serve as intermediates in the purification of compounds or in the

15   preparation of other, for example pharmaceutically acceptable, acid addition salts, or are useful for identification, characterisation or purification.

It will be appreciated that compounds of formula I and formula II possess one or more asymmetric carbon atoms, and that the present invention is directed specifically to individual stereoisomers. The particular stereochemistry of the present compounds is

20   essential to the pharmacological profile of the compounds. In the present specification, where a structural formula does not specify the stereochemistry at one or more chiral centres, it encompasses all possible stereoisomers and all possible mixtures of stereoisomers (including, but not limited to, racemic mixtures), which may result from stereoisomerism at each of the one or more chiral centers.

25   The compounds of the present invention may be used as medicaments in human or veterinary medicine. The compounds may be administered by various routes, for example, by oral or rectal routes, topically or parenterally, for example by injection, and are usually employed in the form of a pharmaceutical composition.

Such compositions may be prepared by methods well known in the

30   pharmaceutical art and normally comprise at least one active compound in association with a pharmaceutically acceptable diluent, excipient or carrier. In making the compositions of the present invention, the active ingredient will usually be mixed with a

-12-

carrier or diluted by a carrier, and/or enclosed within a carrier which may, for example, be in the form of a capsule, sachet, paper or other container. Where the carrier serves as a diluent, it may be solid, semi-solid, or liquid material which acts as a vehicle, excipient or medium for the active ingredient. Thus, the composition may be in the form of tablets,

5   lozenges, sachets, cachets, elixirs, suspensions, solutions, syrups, aerosols (as a solid or in a liquid medium), ointments containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, injection solutions and suspensions and sterile packaged powders.

Some examples of suitable carriers are lactose, dextrose, vegetable oils, benzyl

10 alcohols, alkylene glycols, polyethylene glycols, glycerol triacetate, gelatin, carbohydrates such as starch and petroleum jelly, sucrose sorbitol, mannitol, starches, gum acacia,calcium phosphate, alginates, tragacanth, gelatin, syrup, methyl cellulose, methyl- and propyl- hydrobenzoate, talc, magnesium stearate and mineral oil. The compounds of formula (I) can also be lyophilized and the lyophilizates obtained used, for

15 example, for the production of injection preparations. The preparations indicated can be sterilized and/or can contain auxiliaries such as lubricants, preservatives, stabilizers and/or wetting agents, emulsifiers, salts for affecting the osmotic pressure, buffer substances, colourants, flavourings and/or one or more further active compounds, e.g. one or more vitamins. Compositions of the invention may be formulated so as to provide,

20 quick, sustained or delayed release of the active ingredient after administration to the patient by employing procedures well known in the art.

The compositions are preferably formulated in a unit dosage form, each dosage unit containing from about 5 to about 500 mg, more usually about 25 to about 300 mg, of the active ingredient. The term "unit dosage form" refers to physically discrete units

25 suitable as unitary doses for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical carrier.
The following Examples illustrate compounds of the present invention and

30 methods for their synthesis.

-13-

Stereochemical Conventions

The absolute stereochemistry of compounds according to the present invention may be determined by reference to X-ray crystallography for the following (2S,2'S) compound

X-ray crystallographic data for the above compound is listed in Tables 1-6 herein.
All of the Examples herein were obtained as single isomers either through the use of chirally pure starting material or chiral separation methods, such as HPLC.

EXAMPLE 1

(2R)-2-((R)-[4-methoxyphenyl]{[2-methoxyphenyl]thio}methyl)morpholine hydrochloride

i) (+/-)-[4-Methoxyphenyl][(4-benzylmorpholin-2-yl]methanone

To stirred magnesium turnings (5.4g, 0.22mol) in dry THF (20ml) at room temperature under nitrogen was added sufficient 1,2-dibromoethane (ca. 0.3ml) to create an exotherm. A solution of 4-bromoanisole (13.90g, 74.25mmol) in dry THF (25ml) was then added dropwise at a rate to maintain a gentle reflux. After addition, allowed to cool to below 30°C then added over 5 min. period to a stirred solution of 4-benzyl-2-cyanomorpholine (5.0g, 24.75mmol) in dry THF (50ml) cooled to –20°C under nitrogen. After addition stirred at room temperature for 30 min. then cooled to 0°C and added 5M

-14-

HCl (25ml) dropwise. After 5 min. stirring, made basic by addition of 2M NaOH and the resulting suspension filtered through celite. The aqueous phase was separated and washed with diethyl ether (2x). The combined organic phases was dried over magnesium sulphate, filtered and evaporated to a yellow oil. The oil was purified by flash

5   chromatography on silica eluting with ethyl acetate/heptane gradient 25/75 to 70/30 to give required product as a yellow oil (5.46g).

ii) (R)-[4-methoxyphenyl][(2S)-4-benzylmorpholin-2-yl]methanol and (S)-[4-methoxyphenyl][(2R)-4-benzylmorpholin-2-yl]methanol

10
To a stirred solution of (+/-)-[4-Methoxyphenyl][4-benzylmorpholin-2-yl]methanone (5.40g, 17.36mmol) in methanol (60ml) at 5°C was added sodium borohydride (1.31g, 34.72mmol) portionwise. The mixture was stirred at room temperature for 1.5h, cooled to 10°C and added water to terminate reaction. Concentrated

15   *in vacuo,* diluted with water and extracted with ethyl acetate (2x). Extracts washed with water and brine, dried over magnesium sulphate, filtered and evaporated to an oil. The crude mixture of diastereomers was purified and separated by flash chromatography on silica eluting with diethyl ether/toluene (3/2) to give the title diastereomer as a colourless oil (2.14g).
20

iii) (2R)-2-((R)-[4-methoxyphenyl]{[2-methoxyphenyl]thio}methyl)-4-benzylmorpholine and (2S)-2-((S)-[4-methoxyphenyl]{[2-methoxyphenyl]thio}methyl)-4-benzylmorpholine

A mixture of (R)-[4-methoxyphenyl][(2S)-4-benzylmorpholin-2-yl]methanol and
(S)-[4-methoxyphenyl][(2R)-4-benzylmorpholin-2-yl]methanol (118mg, 0.376mmol),
2,2'-dimethoxydiphenyldisulphide (210mg, 0.75mmol) and tributylphosphine (152mg,

5   1.50mmol) in dry THF (2ml) was heated at reflux under nitrogen overnight. The reaction
mixture was cooled to room temperature and evaporated to an oil. The crude oil was
purified by flash chromatography on silica eluting with heptane/ethyl acetate (4/1 then
3/2) to give the product as a colourless oil (95mg).

10   *iv) (2R)-2-((R)-[4-methoxyphenyl]{[2-methoxyphenyl]thio}methyl)morpholine
hydrochloride*

Stirred (2S)-2-((S)-[4-methoxyphenyl]{[2-methoxyphenyl]thio}methyl)-4-
benzylmorpholine (2R)-2-((R)-[4-methoxyphenyl]{[2-methoxyphenyl]thio}methyl)-4-

15   benzylmorpholine (618mg, 1.42mmol) with solid supported Hunig's base (2.40g,
8.52mmol) and α-chloroethyl chloroformate (2.0g, 14.21mmol) in dichloromethane
(12ml) at room temperature under nitrogen for 4h. Filtered and concentrated *in vacuo* ,
dissolved oil in methanol and heated at 60°C for 1.5h. Cooled to room temperature and
purified by SCX column chromatography eluting with ammonia/methanol (ca. 3M) gave
a colourless oil. The desired diastereomer was separated on chiralcel-OJ column eluting

with heptane/ethanol/dimethylethylamine (20/80/0.2) : 8.98 min. The required product

was then obtained (60%de) after chiral chromatography on chiralpak-OD column eluting

with heptane/isopropanol (70/30) : 17.41min. It was converted into the HCl salt, NMR

5   (DMSO) 9.39 (2H, br. s), 7.3-7.1 (4H, m), 6.94-6.72 (4H, m), 4.6-4.5 (1H, m), 4.12-3.92

(2H, m), 3.85-3.62 (7H, m), 3.46-3.32 (1H, m), 3.20-3.08 (1H, m), 3.04-2.89 (2H, m).

LCMS: m/z 346 [M+H]$^+$ @ Rt 4.24 min.

EXAMPLE 2:

10   **(2R)-2-((R)-(2-Fluorophenyl){[2-methoxyphenyl]thio}methyl)morpholine hydrochloride**

*i) (2R)-2-[(R)-(2-fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one, (2S)-2-[(S)-
(2-fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one, (2R)-2-[(S)-(2-*

15   *fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one and (2S)-2-[(R)-(2-
fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one*

To a stirred solution of (+/-)-4-benzylmorpholin-3-one (10.0g, 0.052mol) and 2-

fluorobenzaldehyde (7.74g, 0.062mol) in dry THF (80ml) cooled under nitrogen to –78°C

20   was added dropwise a solution of lithium diisopropylamide in heptane/THF/ethylbenzene

(2M, 31.2ml). After addition , stirred at –78°C for 0.5h then allowed to warm to 0°C

before quenching with aqueous saturated ammonium chloride. Concentrated *in vacuo* and

extracted with dichloromethane (2x). The extracts were dried over magnesium sulphate,

filtered and evaporated to an oil. Purified on a pad of flash silica eluting with

25   heptane/ethyl acetate (100/0, 80/20, 60/40 and 50/50) to give a 1:1 mixture of the

diastereomers as a colourless oil (12.05g).

-17-

ii)   (R)-[2-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methanol and (S)-[2-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methanol

5   To a stirred solution of (2R)-2-[(R)-(2-fluorophenyl)(hydroxy)methyl]-4-
benzylmorpholin-3-one, (2S)-2-[(S)-(2-fluorophenyl)(hydroxy)methyl]-4-
benzylmorpholin-3-one, (2R)-2-[(S)-(2-fluorophenyl)(hydroxy)methyl]-4-
benzylmorpholin-3-one and (2S)-2-[(R)-(2-fluorophenyl)(hydroxy)methyl]-4-
benzylmorpholin-3-one (12.0g, 0.038mol) in dry THF (80ml) under nitrogen at room
10   temperature was added a solution of borane in THF (1M, 150ml). The solution was
heated at 60°C for ca. 4h then at room temperature overnight. Cooled solution to 0°C and
added dropwise methanol (68ml) followed by 1NHCl (68ml). The resulting mixture was
heated at 60°C for 1h, cooled and concentrated *in vacuo*. The precipitate was removed by
filtration and the filtrate made basic with aqueous sodium carbonate. Extracted with
15   diethyl ether (3x), extracts washed with water and brine, dried over magnesium sulphate,
filtered and evaporated to an oil. The crude oil was purified and partially separated by
flash chromatography on silica eluting with heptane/ethyl acetate (40/60 to 25/75) to give
the product as a colourless oil (0.713g).

20   *iii)   (R)-[2-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methyl methanesulphonate and
(S)-[2-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methyl methanesulphonate*

25

-18-

To a stirred solution of (R)-[2-fluorophenyl][(2S)-4-benzylmorpholin-2-
yl]methanol and (S)-[2-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methanol (465mg,
1.54mmol) in dry dichloromethane (10ml) at room temperature under nitrogen was added
triethylamine (202mg, 2.0mmol) and methanesulphonyl chloride (177mg, 1.54mmol).
After 15h, evaporated to an oil and purified by flash chromatography on silica eluting
with ethyl acetate/heptane (1/1) to give the product mesylate as a colourless oil (445mg).

*iv)   (2R)-2-((R)-[2-fluorophenyl]{[2-methoxyphenyl]thio}methyl)-4-benzylmorpholine
and (2S)-2-((S)-[2-fluorophenyl]{[2-methoxyphenyl]thio}methyl)-4-benzylmorpholine*

To a stirred suspension of (R)-[2-fluorophenyl][(2S)-4-benzylmorpholin-2-
yl]methyl methanesulphonate and (S)-[2-fluorophenyl][(2R)-4-benzylmorpholin-2-
yl]methyl methanesulphonate (445mg, 1.17mmol) and anhydrous potassium carbonate
(0.97g, 7.02mmol) in dry degassed DMF (8ml) under nitrogen at room temperature was
added 2-methoxybenzenethiol (0.82g, 5.87mmol). After stirring at room temperature for
18h, diluted with water and extracted with diethyl ether (2x). The extracts were washed
with 2NaOH, water and brine, dried over magnesium sulphate, filtered and evaporated to
an oil.

After purification by flash column chromatography (eluent: heptane/ethyl acetate
80/20 [v/v]) the title product was obtained as a colourless oil (357 mg); MW 423.55;

-19-

$C_{25}H_{26}FNO_2S$; ^1H NMR (CDCl$_3$): 6.65-7.5 (13H, m), 4.9 (1H, d, 7 Hz), 3.9-4.05 (2H, m), 3.8 (3H, s), 3.6 (1H, dt, 8 Hz and 1 Hz), 3.45 (1H, d, 13.1 Hz), 3.15 (1H, d, 13.1 Hz), 2.60 (2H, t, 8 Hz), 2.05-2.2 (2H, m); FIA: m/z 424 [M+H]$^+$.

5   v) (2R)-2-((R)-(2-Fluorophenyl){[2-methoxyphenyl]thio}methyl)morpholine hydrochloride
Reaction of the mixture of (2R)-2-((R)-[2-fluorophenyl]{[2-methoxyphenyl]thio}methyl)-4-benzylmorpholine and (2S)-2-((S)-[2-fluorophenyl]{[2-

10   methoxyphenyl]thio}methyl)-4-benzylmorpholine (430 mg, 1.02 mmol) following procedure described in EXAMPLE 1(iv) gave a colourless oil (340 mg, 90% yield) from which the first eluting enantiomer was obtained after chiral chromatography on a Chiralcel-OD column eluant heptane/ethanol/dimethylethylamine (40/60/0.2): Rt 10.41 min. LC purity = 98.6 (UV$_{254nm}$); MW 333.43; $C_{18}H_{20}FNOS$.; FIA: m/z 334 [M+H]$^+$. This

15   was converted into the hydrochloride salt. ^1H NMR (CDCl$_3$) freebase: 7.2-7.3 (1H, m), 6.85-7.2 (8H, m), 4.85 (1H, d, 8 Hz), 3.95-4.15 (2H, m), 3.85-3.9 (3H, m), 3.7 (1H, dt, 1 Hz and 7 Hz), 2.6-3.0 (4H, m).

EXAMPLE 3

20   **(2R)-2-((R)-[2,5-dichlorophenyl][phenylthio]methyl)morpholine hydrochloride**
i)   (2R)-2-((R)-[2,5-dichlorophenyl][phenylthio]methyl)-4-benzylmorpholine

Reacted (2R)-2-[(S)-bromo(phenyl)methyl]-4-benzylmorpholine (150mg,
25   0.43mmol) (see example 8(v)method 2), 2,5-dichlorobenzenethiol (233mg, 1.30mmol) and anhydrous potassium carbonate (71mg, 0.52mmol) following example 2(iv). The

-20-

reaction mixture was purified directly by SCX chromatography eluting with ammonia/methanol (ca.3M) to give the product as an oil (174mg).

ii)   (2R)-2-((R)-[2,5-dichlorophenyl][phenylthio]methyl)morpholine

5   *hydrochloride*

Debenzylation of (2R)-2-((R)-[2,5-dichlorophenyl][phenylthio]methyl)-4-benzylmorpholine (174mg, 0.39mmol) with polymer supported Hunig's base (0.20g, 0.78mmol) and α-chloroethyl chloroformate (111mg, 0.78mmol) following the procedure

10- described in example 1(iv) gave after SCX chromatography the product as an oil (136mg).
NMR (CDCl₃) 7.31-7.14 (7H, m), 7.00 (1H, d), 4.41 (1H, d), 4.06-3.98 (1H, m), 3.90-3.82 (1H, m), 3.7-3.6 (1H, m), 2.94-2.76 (2H, m), 2.65 (2H, d). *m/z* [M+H] 354/6/8.
Crystallised as the HCl salt from ethanol and diethyl ether.
15

EXAMPLE 4
(2R)-2-((R)-[2,6-dichlorophenyl][phenylthio]methyl)morpholine hydrochloride

i)   (2R)-2-((R)-[2,6-dichlorophenyl][phenylthio]methyl)-4-benzylmorpholine

20

Reacted (2R)-2-[(S)-bromo(phenyl)methyl]-4-benzylmorpholine (200mg, 0.58mmol) (see example 8(iv)), 2,6-dichlorobenzenethiol (130mg, 0.70mmol) and anhydrous potassium carbonate (97mg, 0.70mmol) following example 2(iv). The reaction mixture was purified directly by SCX chromatography eluting with ammonia/methanol

25   (ca.3M) to give the product as an oil (230mg).

-21-

ii)   *(2R)-2-((R)-[2,6-dichlorophenyl][phenylthio]methyl)morpholine hydrochloride*

      Stirred (2R)-2-((R)-[2,6-dichlorophenyl][phenylthio]methyl)-4-benzylmorpholine

5   (230mg, 0.52mmol) with solid supported Hunig's base (270mg, 1.04mmol) and α-

chloroethyl chloroformate (152mg, 1.04mmol) in dichloromethane (4ml) at room

temperature under nitrogen for 3h. Filtered and concentrated *in vacuo* , dissolved oil in

methanol and stirred at room temperature for 1h. Evaporated to give a colourless solid.

NMR (MeOH) 7.32-7.12 (8H, m), 4.62 (1H, d), 4.31-4.22 (1H, m), 4.16-4.06 (1H, m),

10   3.91-3.80 (1H, m), 3.2-2.9 (4H, m).

EXAMPLE 5
(2R)-2-((R)-[4-methylphenyl]{[2-methoxyphenyl]thio}methyl)morpholine hydrochloride
15

i)   *(2R)-2-[(S)-(4-methylphenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one and
(2S)-2-[(R)-(4-methylphenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one*
-22-

To a stirred solution of (+/-)-4-benzylmorpholin-3-one (4.06 g, 21.3 mmol) in

anhydrous THF (25 ml) under nitrogen at -80°C was added lithium diisopropylamide

(2.0M, 19.5 ml) solution in heptane/THF/ethylbenzene dropwise, whilst maintaining the

reaction temperature below -65°C. The resulting solution was stirred for a further 30

5   minutes at -78°C, before being slowly added over approximately 45 minutes to a solution

of 4-methylbenzaldehyde (3.07g, 25.51 mmol) in anhydrous THF (15 ml) under nitrogen

at -78°C, whilst again maintaining the reaction temperature below -75°C. The resulting

yellow solution was stirred at -78°C for 0.5 hour, before being allowed to warm to room

temperature. The reaction mixture was cautiously quenched by addition of saturated

10   ammonium chloride solution (50 ml) and the THF was evaporated *in vacuo* from the

mixture. The resulting cloudy aqueous solution was extracted with dichloromethane, and

the organic extracts were combined, washed with brine, dried over magnesium sulphate,

filtered and the dichloromethane evaporated *in vacuo* to give a thick red oil (9.35 g).

After purification by flash column chromatography (eluent: ethyl acetate/hexane 30/70 to

15   70/30 gradient [v/v]) the colourless oil obtained was triturated with hexane followed by

hot cyclohexane to give after successive decanting of supernatant and drying the product

as a colourless solid (2.46g).

ii)   *(S)-[4-methylphenyl][(2S)-4-benzylmorpholin-2-yl]methanol and (R)-[4-*

20   *methylphenyl][(2R)-4-benzylmorpholin-2-yl]methanol*

The product was prepared from (2R)-2-[(S)-(4-methylphenyl)(hydroxy)methyl]-4-

benzylmorpholin-3-one and (2S)-2-[(R)-(4-methylphenyl)(hydroxy)methyl]-4-

benzylmorpholin-3-one (2.50g, 8.04mmol) following the procedure described in

25   EXAMPLE 2(ii). The oil was purified by flash chromatography on silica eluting with

ethyl acetate/heptane gradient 30/70 to 70/30 to give required product as an oil (1.16g).

-23-

iii)   *(2R)-2-[(S)-bromo(4-methylphenyl)methyl]-4-benzylmorpholine and (2S)-2-[(R)-bromo(4-methylphenyl)methyl]-4-benzylmorpholine*

5   To a stirred solution of (S)-[4-methylphenyl][(2S)-4-benzylmorpholin-2-yl]methanol and (R)-[4-methylphenyl][(2R)-4-benzylmorpholin-2-yl]methanol (1.16g, 3.91mmol) and triphenylphosphine (1.54g, 5.87mmol) in dry dichloromethane was added dropwise a solution of carbon tetrabromide (1.95g, 5.87mmol) in dichloromethane over a period of 10min. Further triphenylphosphine (0.5eq) and carbon tetrabromide (0.5eq)

10   were added after 0.5h. Quenched reaction mixture after 2h with saturated aqueous sodium bicarbonate. Extracted with dichloromethane, dried extracts over magnesium sulphate, filtered and evaporated to a red oil. Triturated oil with diethyl ether, filtered and evaporated to a yellow oily solid. The oil was purified by flash chromatography on silica eluting with ethyl acetate/heptane 20/80 to give the product as an oil (0.61g)

15

iv)   *(2R)-2-((R)-[4-methylphenyl]{[2-methoxyphenyl]thio}methyl)-4-benzylmorpholine and (2S)-2-((S)-[4-methylphenyl]{[2-methoxyphenyl]thio}methyl)-4-benzylmorpholine*

(2R)-2-((R)-[phenyl][2-trifluoromethylphenylthio]methyl)morpholine hydrochloride

15
Method 1

(i)   *4-Benzylmorpholin-3-one*

-29-
A solution of *N*-benzyl-*N*-(2-hydroxyethyl)chloroacetamide (1.0 eq., 627.7 g, 2.759 mol) in tert-butanol (0.9 L) was stirred under nitrogen while warming to 25-30 °C. A 1.0 M

5   solution of potassium tert-butoxide in tert-butanol (1.05 eq., 2.897 L, 2.897 mol) was added over 2 hours, maintaining the reaction temperature between 30 and 32 °C. The reaction mixture was stirred at 27-28 °C for 90 minutes. When TLC showed the reaction to be complete, ice-cold water (6 L) was added and the resultant cloudy solution extracted with EtOAc (1 x 3 L, 2 x 1.5 L). The combined organic layers were washed with brine (2

10   x 3 L), dried over MgSO4 and evaporated *in vacuo* to give a light brown oil (441 g, 84% yield), which was used in the next stage without further purification; MW 191.23; C11H13NO2; Rf 0.52 (80% EtOAc, 20% hexane); 1H NMR (CDCl3): 7.40-7.29 (5H, m), 4.67 (2H, s), 4.28 (2H, s), 3.87 (2H, t, 5.4 Hz), 3.31 (2H, t, 5.4 Hz); LCMS: m/z 192 [M+H]+ @ Rt 1.00 min (single major peak).

15

*(ii)   (2R)-4-benzyl-2-[(S)-hydroxy(phenyl)methyl]morpholin-3-one, (2S)-4-benzyl-2-
[(R)-hydroxy(phenyl)methyl]morpholin-3-one and (2R)-4-benzyl-2-[(R)-
hydroxy(phenyl)methyl]morpholin-3-one, (2S)-4-benzyl-2-[(S)-
hydroxy(phenyl)methyl]morpholin-3-one*

20
-30-

To a stirred solution of 4-benzylmorpholin-3-one (5.02 g, 26 mmol) in anhydrous

THF (25 ml) under nitrogen at -78°C was added a 2 M. solution of LDA in

heptane/THF/ethylbenzene (1.5 eq., 39 mmol, 19.5 ml) over approximately 20 minutes,

whilst maintaining the reaction temperature below -75°C. The resulting brown solution

5   was stirred for a further 30 minutes at -78°C , before being slowly added over

approximately 30 minutes to a solution of benzaldehyde (1.2 eq., 3.34 g, 31 mmol) in

anhydrous THF (15 ml) under nitrogen at -78°C , whilst again maintaining the reaction

temperature below -75°C . The resulting yellow solution was stirred at -78°C for 1 hour,

before being allowed to warm to room temperature slowly over 1 hour. The reaction

10   mixture was cautiously quenched by addition of saturated ammonium chloride solution

(50 ml) and the THF was evaporated *in vacuo* from the mixture. The resulting cloudy

aqueous solution was extracted with DCM (3 x 50 ml), and the organic extracts were

combined, washed with brine (50 ml), dried over Na_2SO_4 and the DCM evaporated *in

vacuo* to give a thick brown oil (9.2 g), which partially crystallised on standing. The

15   mixture of diastereoisomeric alcohols was purified and separated by flash column

chromatography using gradient elution (from 10% EtOAc, 90% DCM to 20% EtOAc,

80% DCM), which gave (2R)-4-benzyl-2-[(S)-hydroxy(phenyl)methyl]morpholin-3-one

and (2S)-4-benzyl-2-[(R)-hydroxy(phenyl)methyl]morpholin-3-one as light red crystals

(2.461 g, 31% yield); MW 297.36; C18H19NO3; Rf 0.40 (50% EtOAc, 50% hexane); 1H

20   NMR (CDCl3): 7.41-7.36 (2H, m), 7.31-7.16 (6H, m), 6.91-6.86 (2H, m), 5.14 (1H, d, J

3.5 Hz), 4.71 (1H ,d, 14.5 Hz), 4.48 (1H, d, J 3.5 Hz), 4.25 (1H, d, 14.5 Hz), 4.20 (1H, br.

s), 3.89 (1H, ddd, 11.7 Hz, 2.5 Hz, 2.0 Hz), 3.67 (1H, dt, 11.2 Hz, 3.4 Hz), 3.16 (1H, dt,

12.0 Hz, 4.0 Hz), 2.86 (1H, br. d, 12.0 Hz); LCMS: m/z 298 [M+H]+ @ Rt 1.24 min

(single major peak). This reaction was performed on scales from 200 mg to 5 g (yield

25   range 20 to 40%). (2R)-4-benzyl-2-[(R)-hydroxy(phenyl)methyl]morpholin-3-one and

(2S)-4-benzyl-2-[(S)-hydroxy(phenyl)methyl]morpholin-3-one diastereoisomer was

isolated as a brown solid (1.42 g) contaminated with *N*-benzylmorpholin-3-one.

Trituration with EtOAc afforded the pure compound as a white solid (0.484 g, 6% yield);

MW 297.36; C18H19NO3; Rf 0.23 (50% EtOAc, 50% hexane); 1H NMR (CDCl3): 7.61-

30   7.55 (2H, m), 7.50-7.36 (6H, m), 7.31-7.25 (2H, m), 5.21 (1H, d, 2.3 Hz), 5.09 (1H, d, J

7.7 Hz, 2.3 Hz), 4.73 (2H, s, s Hz), 4.37 (1H, d, J 7.7 Hz), 4.01(1H, ddd, 12.0 Hz, 2.6 Hz,

-31-

1.9 Hz), 3.77 (1H, dt, 11.0 Hz, 3.5 Hz), 3.50 (1H, dt, 12.0 Hz, 4.0 Hz), 3.16 (1H, br. d,

12.0 Hz); LCMS: m/z 298 [M+H]+ @ Rt 1.24 min (single major peak).

(iii)   (S)-[(2S)-4-benzylmorpholinyl](phenyl)methanol and (R)-[(2R)-4-benzylmorpholinyl](phenyl)methanol

5
To a solution of (2R)-4-benzyl-2-[(S)-hydroxy(phenyl)methyl]morpholin-3-one

and (2S)-4-benzyl-2-[(R)-hydroxy(phenyl)methyl]morpholin-3-one (326 mg, 1.1 mmol)

in anhydrous THF (5 ml) under nitrogen at room temperature was slowly added a 1 M

solution of borane in THF (4 eq., 4.4 ml, 4.4 mmol). The solution was stirred at 60°C for

10   2 hours. After cooling down to room temperature, dry methanol (2 ml) was slowly added

to quench excess borane reagent. 1 M. Aqueous hydrochloric acid solution (2 ml) was

added and the reaction mixture was heated to 60°C for 1 hour. The organic solvents were

evaporated *in vacuo* and the concentrated solution was poured onto 1 M aqueous

potassium carbonate solution (10 ml) and extracted with diethyl ether (2 x 20 ml). The

15   combined organic layers were washed with brine (20 ml), water (20 ml), dried over

MgSO4 and concentrated *in vacuo*. The resultant oil was purified by flash column

chromatography (90% hexane, 9% EtOAc, 1% NEt3) to give a viscous oil (189 mg, 60%

yield); MW 283.37; C18H21NO2; Rf 0.42 (90% EtOAc, 10% hexane); 1H NMR

(CDCl3): 7.45-7.32 (10H, m), 4.67 (1H, d, 7.3 Hz), 4.03 (1H, dt, 11.4 Hz, 2.7 Hz), 3.86-

20   3.73 (2H, m), 3.64 (1H, d, 13.2 Hz), 3.39 (1H, d, 13.2 Hz), 3.30 (1H, br. s), 2.68 (1H, d,

12.7 Hz), 2.56 (1H, d, 10.9 Hz), 2.28-2.15 (2H, m); LCMS: m/z 284 [M+H]+ @ Rt 0.95
min (single major peak).

This reaction was performed on scales from 50 mg to 1.5 g (yield range = 50 to

84%).

25

-32-

*(iv)   (R)-[(2S)-4-benzylmorpholinyl](phenyl)methanol and (S)-[(2R)-4-
benzylmorpholinyl](phenyl)methanol*

Using the procedure described in Example 8(iii) starting from (2R)-4-benzyl-2-

5   [(R)-hydroxy(phenyl)methyl]-morpholin-3-one and (2S)-4-benzyl-2-[(S)-
hydroxy(phenyl)methyl]-morpholin-3-one (135 mg, 0.51 mmol) the reaction and
subsequent purification yielded a viscous oil (98 mg, 68% yield); MW 283.37;
$C_{18}H_{21}NO_2$; Rf 0.52 (100% EtOAc); 1H NMR (CDCl3): 7.28-7.17 (10H, m), 4.80 (1H, d,
4.0 Hz), 3.88 (1H, dt, 11.4 Hz, 3.0 Hz), 3.72 (1H, m), 3.68-3.61 (1H, m), 3.50 (1H, d, 13

10   Hz), 3.25 (1H, d, 13 Hz), 2.52 (2H, br. t, 12.0 Hz), 2.17 (1H, t, 11 Hz), 2.08 (1H, td, 11
Hz, 3.0 Hz), OH not observed; LCMS: m/z 284 [M+H]+ @ Rt 0.98 min (single major
peak). This reaction was performed on scales from 100 to 400 mg (yield range = 60 to
93%).

15   *(v)   (2R)-4-benzyl-2-[(S)-bromo(phenyl)methyl]morpholine and (2S)-4-benzyl-2-[(R)-
bromo(phenyl)methyl]morpholine*
To a solution of (S)-[(2S)-4-benzylmorpholinyl](phenyl)methanol and (R)-[(2R)-
4-benzylmorpholinyl](phenyl)methanol (10.27 g, 36.29 mmol) in anhydrous

20   dichloromethane (150 ml) under nitrogen at room temperature was added freshly
recrystallised triphenylphosphine (1.4 eq., 13.310 g, 50.80 mmol) followed by carbon
tetrabromide (1.4 eq., 16.849 g, 50.80 mmol) as a solution in anhydrous dichloromethane
(50 ml). After 15 minutes the reaction mixture was diluted with dichloromethane (100 ml)

-33-

and washed with saturated aqueous sodium hydrogencarbonate solution (150 ml), brine (150 ml), dried over MgSO4 and concentrated *in vacuo* to give an orange oil (42.0 g). To the orange oil was added diethyl ether (200 ml) and the resulting suspension was sonicated for 30 minutes. The solvent was decanted and the process repeated with a

5   further portion of diethyl ether (200 ml). The combined ethereal extracts were concentrated *in vacuo* to yield an orange solid (22.0 g) which was purified by flash column chromatography (10% EtOAc : 89.5% Hexane, 0.5% Triethylamine) to give a white solid (7.20 g, 58% yield). Alternative Work-up: The reaction mixture was poured onto a silica (160 g) filtration pad which was washed using suction with dichloromethane

10   (14 x 250 ml). Stripping this filtrate *in vacuo* gave crude product (16.0 g, 131% uncorrected). This was purified by flash column chromatography (5% EtOAc : 94.5% Hexane : 0.5% Triethylamine to 10% EtOAc : 89.5% Hexane : 0.5% Triethylamine) to give a white solid (6.05 g, 50% yield); MW 346.27; C18H20BrNO; Rf 0.76 (70% EtOAc, 30% hexane); 1H NMR (CDCl3): 7.39-7.14 (10H, m), 4.83 (1H, d, 7.4 Hz), 4.01 (1H, br.

15   t, 8.3 Hz), 3.73 (1H, br. d, 11.1 Hz), 3.60-3.48 (2H, m), 3.39 (1H, d, 12 Hz), 3.20 (1H, d, 11.4 Hz), 2.50 (1H, d, 10.4 Hz), 2.07 (2H, t, 10.9 Hz); LCMS: m/z 348/346 [M+H]+ @ Rt 1.20 min (single major peak). This reaction was performed on scales from 100 to 400 mg (yield range = 60 to 93%).

A sample of racemic (2R)-4-benzyl-2-[(S)-bromo(phenyl)methyl]morpholine and

20   (2S)-4-benzyl-2-[(R)-bromo(phenyl)methyl]morpholine (6.02g) was separated by preparative chiral chromatography (Chiralcel-AD 1kg column, ethanol: dimethylethylamine 100: 0.3) to give the first eluting enantiomer Rt 23.4min as an off-white solid (2.89g) of (2R)-4-benzyl-2-[(S)-bromo(phenyl)methyl]morpholine and the second eluting enantiomer Rt 28.9min as an off-white solid (2.89g) of (2S)-4-benzyl-2-

25   [(R)-bromo(phenyl)methyl]morpholine (2.21g)

vi) (2R)-2-((R)-[phenyl]{[2-trifluoromethylphenyl]thio}methyl)-4-benzylmorpholine and
(2S)-2-((S)-[phenyl]{[2-trifluoromethylphenyl]thio}methyl)-4-benzylmorpholine

30

-34-
To a stirred solution of 2-trifluoromethylthiophenol (2.469g, 13.86mmol) and
(2R)-2[(S)-bromo(4-methylphenyl)methyl)-4-benzylmorpholine and (2S)-2[(R)-bromo(4-
5 methylphenyl)methyl)-4-benzylmorpholine (4.0g, 11.55mmol) in anhydrous DMF (60ml)
at room temperature under nitrogen was added cesium carbonate (4.14g, 12.71g). The
reaction mixture was heated at 95°C for 1h. The reaction mixture was cooled to room
temperature, diluted with ethyl acetate, then washed sequentially with water, brine, dried
over magnesium sulphate, filtered and evaporated to a brown oil. The oil was purified by
10 flash column chromatography (eluent: hexane/ethyl acetate gradient 100 to 90/10 [v/v]) to
give a yellow oil (4.83 g, 94% yield); MW 444; $C_{25}H_{24}F_3NOS$; ^{1}H NMR (CDCl$_3$): 7.60
(1H, dd, 7.2 Hz, 1.4 Hz), 7.17-7.39 (13H, m), 4.50 (1H, d, 7.2 Hz), 3.97-4.12 (2H, m),
3.73 (1H, dt, 9.7 Hz, 2.3 Hz), 3.59 (1H, d, 12.6 Hz), 3.37 (1H, d, 12.6 Hz), 2.57-2.68 (2H,
m); 2.18-2.38 (2H, m); LCMS (2.5 minutes method): m/z 445 [M+H]+ @ Rt 1.50 min.

15

vii) (2R)-2-((R)-[phenyl][2-trifluoromethylphenylthio]methyl)morpholine hydrochloride

The title compound was obtained from (2R)-2-((R)-[phenyl]{[2-
trifluoromethylphenyl]thio}methyl)-4-benzylmorpholine and (2S)-2-((S)-[phenyl]{[2-

trifluoromethylphenyl]thio}methyl)-4-benzylmorpholine (5.25 g, 11.84 mmol), solid

supported Hunig's base (Argonaut, 3.56 mmol/g, 6.64 g, 23.67 mmol, 2 eq.) and α-

chloroethyl chloroformate (3.83 ml, 35.51 mmol, 3 eq.) in anhydrous dichloromethane

(75 ml) at 40°C following the method described in example 1(iv). After evaporation of

5   the methanol solution a light brown solid (5.60 g) was obtained which was recrystallised

from iso-propanol to give the hydrochloride salt as fine white needles. The hydrochloride

salt was suspended in ethyl acetate and washed with an aqueous solution of sodium

hydroxide (50 ml of a 1M solution). The organic layer was washed with brine, dried over

MgSO$_4$ and concentrated *in vacuo* to yield the free amine as a colourless oil (3.10 g, 74%

10   yield); MW 353.41; C$_{18}$H$_{18}$F$_3$NOS; ^{1}H NMR (CDCl$_3$): 7.46 (1H, d, 7.7 Hz), 7.24 (1H, d,

7.3 Hz), 7.05-7.2 (7H, m), 4.28 (1H, d, 7.7 Hz), 3.92 (1H, d, 11.4 Hz), 3.80 (1H, q, 7.0

Hz), 3.58 (1H, dt, 1.82 Hz, 11.4 Hz), 2.69-2.87 (2H, m), 2.59 (2H, d, 6.0 Hz), 2.13-1.90

(1H, br s); LCMS (10 minutes method): m/z 354 [M+H]+ @ Rt 5.26 min.

A sample of the racemic free base (1.384g) was separated by preparative chiral

15 . chromatography (Chiralpak-OJ, heptane: isopropanol: dimethylethylamine 70: 30: 0.2) to

give the first eluting enantiomer Rt 9.5min (0.57g) as an oil. Redissolved in diethyl ether

(20ml) and treated with ethereal hydrogen chloride (2M 0.8ml) to give a white solid

(566mg, mp 240-1°C) of the title product (2R)-2-((R)-[phenyl][2-

trifluoromethylphenylthio]methyl)morpholine hydrochloride.

20   The second eluting enantiomer Rt 15.8min was obtained as an oil (0.55g) and

similarly converted to the hydrochloride salt (2S)-2-((S)-[phenyl][2-

trifluoromethylphenylthio]methyl)morpholine hydrochloride (556mg mp 244-5°C). A

sample (20mg) was crystallised from isopropanol (2ml) allowing the solvent to evaporate

slowly over several weeks. The crystals were analysed by xray crystallography to

25   confirm the absolute stereochemistry as (S,S) for the second eluting enantiomer, data is

listed in tables 1-6 herein.

Method 2

    (i)   4-benzyl-morpholine-2-carbonitrile

30

A one-liter reactor with mechanical stirring, cooled by ice bath, was charged with N-benzylethanolamine (172.2 g, 1.14 mol). 2-Chloroacrylonitrile (100g, 1.14 mol) was added dropwise over a period of 2 minutes. The temperature was kept between 23°C and 29°C using an ice bath, progressively replaced by a water bath at 15°C. After stirring at room temperature over night the mixture was dissolved in THF and transferred into a 2l reactor cooled to –5°C by an ice/NaCl bath. The total volume of THF equalled 1.35l. Potassium tert-butoxide (148g, 1.1 eq.) was added in portions over 1hour, while maintaining the temperature at 0±2°C. After 1 hour stirring at 0°C the mixture was quenched by saturated NaHCO$_3$ (500ml). The aqueous layer was extracted with diethyl ether. The organic layers were dried over MgSO$_4$ and evaporated to dryness. After percolation of the 250 g dry residue on 1 kg SiO$_2$ (eluent: ethyl acetate/n-heptane gradient 5/95 to 80/100 [v/v]) 4-benzyl-morpholine-2-carbonitrile was obtained as a clear oil (149.8g, 65%).

(ii)   (2S)-(4-Benzyl-morpholin-2-yl)-phenyl-methanone and (2R)-(4-Benzyl-morpholin-2-yl)-phenyl-methanone
A 3l double jacket reactor was charged with 4-benzyl-morpholine-2-carbonitrile (135.05 g; 1eq) and dry diethyl ether (1.4l). Alternatively, toluene may be used in place of diethyl ether. When Tj=0°C and Tm=1°C (Tj = temperature of the jacket, Tm = temperature of the mass), phenyl magnesium chloride (2M sol. in THF, 360ml, 1.08 equiv) was added dropwise over 1hour. Tm rose to 4°C and came back to 2°C at the end of the addition. Tm was progressively raised to 17.5°C within 45 minutes and the mixture stirred at this temperature for another 45 minutes. The reactor was cooled down to Tm=2°C and Tj=0°C (75 minutes) and hydrochloric acid (700ml of 5N solution) was added in two portions. Tm rose to 33°C. After some minutes, the hydrochloride salt of the ketone crystallised. When Tm=Tj=room temperature, the triphasic suspension was

-37-

filtered. The organic layer of the mother liquors, which contains impurities, was

eliminated. The filtration cake was then washed with methylene chloride (700ml). This

liquor was charged in the reactor with the acid aqueous layer. Treatment of the

hydrochloride salt: After drying under vacuum, 164.4 g of the hydrochloride

5   contaminated with $MgCl_2$ were suspended in a biphasic mixture of

water/methylenechloride (500ml/800ml). The suspension was basified with aqueous

sodium hydroxide (75 ml of a 30% solution) under ice bath cooling. $Mg(OH)_2$

precipitated and the aqueous layer was extracted with methylene chloride. The organic

layers are filtered on a bed of Celite 512 after adding some Celite to the layers

10   themselves. The filtered organic phase was dried over $MgSO_4$ and evaporated to dryness.

The ketone crystallizes readily on standing (132.4g; 70%). Treatment of the mother

liquors: The combined organic phases were washed with aqueous sodium hydroxide

(750ml of a 2N solution). Celite 512 (160 g) was added to the suspension which was then

filtrated through bed of Celite. The aqueous layer was separated and extracted with

15   methylene chloride. The combined organic phases were dried over $MgSO_4$ and

evaporated to dryness to provide 35.8 g of product enriched with unreacted nitrile. This

fraction could be further purified by percolation on SiO_2. (2S)-(4-benzyl-morpholin-2-yl)-

phenyl-methanone and (2R)-(4-benzyl-morpholin-2-yl)-phenyl-methanone were

separated using preparative chiral chromatography. Alternatively, the two enantiomers

20   may be separated by fractional crystallization from acetonitrile using from 0.55 to 1

equivalent of dibenzoyltartaric acid to generate diastereoisomeric salts of the title

compound. The crystals may be collected by filtration and neutralized with 30% NaOH to

afford the optically enriched title compound.

25   The title compound may also be prepared using the following one-pot synthesis. A

1600 L GL reactor under N_2 was successively loaded with 2-chloroacrylonitrile (33.2 kg,

379 moles) and toluene (114 L) at 21°C. Then, N-benzylethanolamine (57 kg, 377

moles) was added and the reaction mixture was post-agitated at room temperature for

about 17 h. Then, the mixture was diluted with toluene (336 L), cooled down to – 12.4

30   °C and potassium t-butoxide (42.3 kg, 377 moles) was added in portions (10) maintaining

– 13.7 °C ≤ Tmass ≤ -2.8 °C. The mixture was post-agitated at about 0°C for 2.5 h,

quenched by adding ultra pure water (142.5 L) maintaining 2.1 °C ≤ Tmass ≤ 8.7 °C. The

-38-

aqueous layer (176 kg) was separated after 35 minutes of post-stirring allowing the mixture to reach 15 °C and the toluene layer was washed with ultra pure water (142.5 L) and the aqueous layer (162 kg) was separated. The organic layer was then concentrated under reduced pressure (150 mbars) maintaining Tmass ≤ 60 °C in order to distill 162 kg

5   of toluene. The filtrates were then diluted with toluene (114 L) and treated with SiO_2 (Merck silica gel 60, 0.063-0.1 mm, 74.1 kg) under agitation at room temperature for 1.25 h. SiO_2 was filtered and rinsed with toluene (2x114 L). Then, the filtrates were concentrated under reduced pressure (150 mbars) maintaining Tmass ≤ 60 °C in order to distill 351.8 kg of toluene (KF : 0.01 % w/w H_2O).

10   The solution of 4-Benzyl-morpholine-2-carbonitrile (169.2 kg) was diluted with toluene (157 L) and was cooled to 0°C and phenylmagnesiumchloride (25 wt. % solution in THF, 213 kg, 389 moles, 1.36 molar equiv.) was slowly added (over 3.5 h) to the reaction mixture, maintaining the temperature at – 3 °C ≤ Tmass ≤ 7 °C. The reaction mixture was post-stirred for 2 hours at Tmass ≈ 0°C. Then, the quench was performed by

15   adding acetic acid (8.55 L, Tmass = 5 → 17.2 °C), post stirring 10 minutes and cooling to 5 °C before adding an acetic acid / water mixture (229 L, 33/67 v/v). During the quench, addition was performed at such a rate that Tmass did not exceed 20°C (typical Tmass = 4.6 °C to 10.4 °C). The mixture was post-agitated overnight at RT and the aqueous layer (285.8 kg) was extracted.

20   The toluene layer was cooled to 0°C and a 5 N NaOH aqueous solution (420.1 kg) was slowly added maintaining the temperature at – 2.4 °C ≤ Tmass ≤ 11 °C. The reaction mixture was post-stirred for 1h and the aqueous layer (494.8 kg) was extracted. The toluene layer was concentrated under reduced pressure (50 mbars) maintaining Tmass ≤ 60 °C in order to distill 356.2 kg of toluene and isopropanol (180.4 kg) was added. The

25   toluene was stripped off under reduced pressure (100 mbars) maintaining Tmass ≤ 60 °C in order to distill 186.4 kg of toluene and isopropanol (135 kg) was added again to the mixture. A last distillation of toluene was performed under reduced pressure (50 mbars) maintaining Tmass ≤ 60 °C in order to distill 131 kg of toluene and isopropanol (49.4 kg) was finally added to the mixture and the solution was stirred at RT until crystallization

30   (17 minutes).

-39-

Ultra pure water was added (125.4 L) and the mixture was stirred overnight at RT and cooled down to about 0 °C for 1 hour. The precipitate was filtered and rinsed with a cooled water/isopropanol 50/50 v/v solution (76.6 kg). The wet precipitate was dried under vacuum at Tjack = 35°C for 96 hours to obtain the title compound as an off-white powder with 59 % overall yield. The title compound may be resolved by the fractional crystallisation process described above.

(iii)   (R)-phenyl[(2R)-4-(phenylmethyl)morpholin-2-yl]methanol
To a stirred solution of (+)-DIP chloride (49.6 g, 155 mmol) in dry THF (150 ml) under nitrogen was added (2R)-(4-benzyl-morpholin-2-yl)-phenyl-methanone (16.54g, 58.89 mmol) in one portion. The reaction mixture was stirred at room temperature for 18 hours. The mixture was evaporated *in vacuo* and the crude oil taken up in methanol and absorbed onto 250g SCX-2 ion exchange resin. After elution of borane residues with methanol the product was eluted with 2M ammonia in methanol. Removal of solvent *in vacuo* yielded the product as yellow oil. (11.23g, 67%); MW 283.37; $C_{18}H_{21}NO_2$; ^{1}H NMR (CDCl$_3$): 7.32-7.45 (10H, m), 4.67 (1H, d, 7.3 Hz), 4.03 (1H, dt, 11.4 Hz, 2.7 Hz), 3.86-3.73 (2H, m), 3.64 (1H, d, 13.2 Hz), 3.39 (1H, d, 13.2 Hz), 3.30 (1H, br. s), 2.68 (1H, d, 12.7 Hz), 2.56 (1H, d, 10.9 Hz), 2.28-2.15 (2H, m); LCMS: m/z 284 [M+H]+ @ Rt 0.95 min.

(v)   (2R)-2-[(S)-bromo(phenyl)methyl]-4-(phenylmethyl)morpholine

-40-
To a solution of *(R)*-phenyl[(2*R*)-4-(phenylmethyl)morpholin-2-yl]methanol
(11.2g, 39.58 mmol) in anhydrous chloroform (400 ml) under nitrogen was added
PPh$_3$Br$_2$ (33.41g, 79.15 mmol). The reaction mixture was heated at 60°C overnight. The

5   mixture was allowed to cool to room temperature then washed with saturated aqueous
sodium carbonate solution, dried over MgSO$_4$ and concentrated *in vacuo*. The resulting
residue was purified by flash chromatography on silica (eluent: ethyl acetate:isohexane
1:4) to give a pale yellow oil. Trituration with isohexane gave (2R)-2-[(S)-
bromo(phenyl)methyl]-4-(phenylmethyl)morpholine as a colourless solid (8.54g, 62%);

10   MW 346.27; C$_{18}$H$_{20}$BrNO; ^{1}H NMR (CDCl$_3$): 7.14-7.39 (10H, m), 4.83 (1H, d, 7.4 Hz),
4.01 (1H, br. t, 8.3 Hz), 3.73 (1H, br. d, 11.1 Hz), 3.60-3.48 (2H, m), 3.39 (1H, d, 12 Hz),
3.20 (1H, d, 11.4 Hz), 2.50 (1H, d, 10.4 Hz), 2.07 (2H, t, 10.9 Hz); LCMS: (6 min
method) m/z 346 [M]+ @ Rt 2.51 min.

15   (vi)   (2R)-2-[(S)-bromo(phenyl)methyl]-4-(phenylmethyl)morpholine can then be
converted to the title product (2R)-2-((R)-[phenyl][2-
trifluoromethylphenylthio]methyl)morpholine hydrochloride using the above procedure in
example 8 Method 1 (v) and (vi).

20   **EXAMPLE 9**

(2R)-2-[(R)-[(2-ethylphenyl)thio](phenyl)methyl]morpholine

*i)   (2S)-2-[(S)-[(2-ethylphenyl)thio](phenyl)methyl]-4-(phenylmethyl)morpholine
and (2R)-2-[(R)-[(2-ethylphenyl)thio](phenyl)methyl]-4-(phenylmethyl)morpholine*

-41-
Compound (2*S*)-2-[(*S*)-[(2-ethylphenyl)thio](phenyl)methyl]-4-(phenylmethyl)morpholine and (2*R*)-2-[(*R*)-[(2-ethylphenyl)thio](phenyl)methyl]-4-(phenylmethyl)morpholine was obtained from 2-ethyl-thiophenol (160 mg, 1.16 mmol) and (2R)-4-benzyl-2-[(S)-bromo(phenyl)methyl]morpholine and (2S)-4-benzyl-2-[(R)-bromo(phenyl)methyl]morpholine (200 mg, 0.58 mmol) following a modification of the method described in example 8(vi) in which the reaction mixture was heated to 95°C for 2 hours. After purification by flash column chromatography (eluent: ethyl acetate/hexane 9/1 [v/v]) the product was obtained as a white solid (152 mg, 65 % yield); MW 403.59; $C_{26}H_{29}NOS$; ^{1}H NMR (CDCl3): 6.96-7.40 (14H, m), 4.22 (1H, d, 7.2 Hz), 3.96-4.01 (2H, m), 3.72 (1H, td, 11.1 Hz, 2.2 Hz), 3.52 (1H, d, 13.1 Hz), 3.32 (1H, d, 13.1 Hz), 2.68 (2H, q, 7.7 Hz), 2.59 (2H, br d, 11.7 Hz), 2.06-2.21 (2H, m), 1.12 (3H, t, 7.2 Hz); LCMS (2.5 minute method) m/z 404 [M+H]+ @ Rt 1.49 min.

ii)   *(2R)-2-[(R)-[(2-ethylphenyl)thio](phenyl)methyl]morpholine hydrochloride*

Reaction of (2*S*)-2-[(*S*)-[(2-ethylphenyl)thio](phenyl)methyl]-4-(phenylmethyl)morpholine and (2*R*)-2-[(*R*)-[(2-ethylphenyl)thio](phenyl)methyl]-4-(phenylmethyl)morpholine following the method in example 1(iv) gave a viscous yellow oil (213.3 mg, 86% yield) from which the title product was obtained after chiral separation on chiral OD semi-preparative column; LC purity = 100% (UV254nm) / 100% (ELS); MW 313.47; $C_{19}H_{23}NOS$; ^{1}H NMR (CDCl3): 7.17 (1H, d, 7.6 Hz), 7.12-7.05 (5H,

-42-

m), 7.01 (2H, d, 3.8 Hz), 6.87-6.93 (1H, m), 4.07 (1H, d, 8.1 Hz), 3.92-3.97 (1H, m),

3.74-3.80 (1H, m), 3.59 (1H, td, 11.4 Hz, 3.0 Hz), 2.80 (1H, td, 12.4 Hz, 3.3 Hz), 2.71

(1H, br. d, 12.1 Hz), 2.63-2.54 (4H, m), 1.64 (1H, br. s), 1.04 (3H, t, 7.6 Hz); LCMS (10

minutes method): m/z 314 [M+H]+ @ Rt 5.92 min. (2R)-2-[(R)-[(2-

5   ethylphenyl)thio](phenyl)methyl]morpholine was converted into its hydrochloride salt.

MW 349.93; C$_{19}$H$_{23}$NOS.HCl; ^{1}H NMR (CDCl$_3$): 10.10 (2H, br. s), 7.13-7.28 (8H, m),

7.02-7.08 (1H, m), 4.36 (1H, br. s), 4.01-4.17 (3H, br. m), 3.16-3.31 (2H, br. m), 2.92-

3.09 (2H, br. m), 2.71 (2H, q, 7.7 Hz), 1.15 (3H, t, 7.2 Hz).

10   **EXAMPLE 10**

(2R)-2-[(R)-{[2-(Methyloxy)phenyl]thio}(phenyl)methyl]morpholine hydrochloride

i)   (2S)-2-[(S)-{[2-(Methyloxy)phenyl]thio}(phenyl)methyl]-4-

(phenylmethyl)morpholine and (2R)-2-[(R)-{[2-(Methyloxy)phenyl]thio}(phenyl)methyl]-

15   *4-(phenylmethyl)morpholine*
Compound (2S)-2-[(S)-{[2-(Methyloxy)phenyl]thio}(phenyl)methyl]-4-

(phenylmethyl)morpholine and (2R)-2-[(R)-{[2-

(Methyloxy)phenyl]thio}(phenyl)methyl]-4-(phenylmethyl)morpholine was obtained

20   from 2-methoxy thiophenol (74 µl, 0.574 mmol) and (2R)-4-benzyl-2-[(S)-

bromo(phenyl)methyl]morpholine and (2S)-4-benzyl-2-[(R)-

bromo(phenyl)methyl]morpholine (181 mg, 0.522 mmol) following the method in

example 8(vi) in which the reaction was heated at 95°C for 2.5h. After purification by

flash column chromatography (eluent: ethyl acetate/hexane gradient 15/85 to 25/75 [v/v])

25   the product was obtained as a viscous yellow oil (175 mg, 83% yield); MW 405.56;

$C_{25}H_{27}NO_2S$; ^1H NMR (CDCl$_3$): 7.01-7.26 (12H, m), 6.58-6.63 (2H, m), 4.39 (1H, d, 7.2 Hz), 3.86-3.91 (2H, m), 3.71 (3H, s), 3.56-3.62 (1H, m), 3.42 (1H, d, 10.8 Hz); 3.21 (1H, d, 10.8 Hz), 2.46-2.52 (2H, m), 2.01-2.11 (2H, m); LCMS (10 minutes method): *m/z* 406 [M+H]$^+$ @ R$_T$ 6.09 min.

ii)   *(2R)-2-[(R)-{[2-(Methyloxy)phenyl]thio}(phenyl)methyl]morpholine hydrochloride*

Reaction of (2*S*)-2-[(*S*)-{[2-(Methyloxy)phenyl]thio}(phenyl)methyl]-4-(phenylmethyl)morpholine and (2*R*)-2-[(*R*)-{[2-(Methyloxy)phenyl]thio}(phenyl)methyl]-4-(phenylmethyl)morpholine (100 mg, 0.25 mmol) following the method in example 1(iv) gave a viscous yellow oil (60 mg, 77% yield) from which the product was obtained after chiral separation on a Chiralcel OJ semi-preparative column. LC purity = 100%; MW 315.44; $C_{18}H_{21}NO_2S$; ^1H NMR (CDCl$_3$): 7.14-7.34 (7H, m), 6.74-6.84 (2H, m), 4.50 (1H, d, 8.2 Hz), 4.10 (1H, d, 10.9 Hz), 3.85-4.00 (4H, m), 3.74 (1H, dt, 1.4 Hz, 11.3 Hz), 2.82-3.02 (2H, m), 2.66-3.02 (3H, m); LCMS (10 minutes method): *m/z* 316 [M+H]$^+$ @ R$_t$ 4.87 min. This was converted to its hydrochloride salt.

EXAMPLE 11

(2R)-2-[(R)-{[2-(methylthio)phenyl]thio}(phenyl)methyl]morpholine hydrochloride

i)   *(2R)-2-((R)-[phenyl]{[2-methylthiophenyl]thio}methyl)-4-benzylmorpholine* and *(2S)-2-((S)-[phenyl]{[2-methylthiophenyl]thio}methyl)-4-benzylmorpholine*

-44-
To a solution of (2R)-4-benzyl-2-[(S)-bromo(phenyl)methyl]morpholine and (2S)-
4-benzyl-2-[(R)-bromo(phenyl)methyl]morpholine (4.0 g, 11.55 mmol) and 2-
methylsulphenyl-thiophenol (1.2 eq, 2.17 g, 13.86 mmol) in anhydrous DMF (35 ml) at

5   room temperature under nitrogen was added cesium carbonate (1.18 eq., 14.04 g, 13.63
mmol). The mixture was heated at 50°C for 1.5 hours, allowed to cool to room
temperature, taken up in methanol and treated with SCX-2 (100 g). The SCX-2 was
washed with methanol. The product was obtained as a white solid (4.92 g) after SCX
chromatography (eluent: ammonia/methanol 1/1 [v/v]) and removal of solvents *in vacuo*.

10   Purification by flash column chromatography (eluent: ethyl acetate/isohexane gradient
10/90 to 30/70 [v/v]) gave a white solid (4.04 g, 86%); MW 421.63; $C_{27}H_{25}NOS_2$; ^1H
NMR (CDCl$_3$): 7.03-7.15 (6H, m), 6.93-6.99 (2H, m), 6.74 (1H, td, 7.3 Hz, 1.5 Hz), 4.31
(1H, d, 7.8 Hz), 3.95 (1H, br. d, 12.1 Hz), 3.83 (1H, td, 8.1 Hz, 3.8 Hz), 3.59 (1H, td, 11.1
Hz, 2.8 Hz), 2.82 (1H, td, 12.1 Hz, 3.3 Hz), 2.61-2.75 (3H, m), 2.35 (3H, s), 1.73 (1H, br.

15   s); LCMS (6 minutes method): m/z 422 [M+H]+ @ Rt 3.36 min.

ii)   (2R)-2-[(R)-{[2-(methylthio)phenyl]thio}(phenyl)methyl]morpholine
hydrochloride

20   To a suspension of polymer supported Hunig's base (5.02 g) and (2R)-2-((R)-
[phenyl]{[2-methylthiophenyl]thio}methyl)-4-benzylmorpholine and (2S)-2-((S)-
[phenyl]{[2-methylthiophenyl]thio}methyl)-4-benzylmorpholine (4.02 g, 9.49 mmol) in

-45-

dry dichloromethane (70 ml) was added α-chloroethyl chloroformate (2.93 ml, 28.6

mmol, 3 eq.) at room temperature and under nitrogen. The mixture was heated at 40°C for

1.5 hours then left to stir at room temperature overnight. The reaction mixture was filtered

and concentrated *in vacuo* to give a pale orange liquid. This was taken up in methanol (70

5   ml) and heated at 40°C for 2 hours. A white solid crashed out of the solution which was

purified by SCX chromatography (eluent: ammonia/methanol 1/1 [v/v]). After

evaporation *in vacuo* the product was obtained as a pale yellow oil (3.13 g, 99%); MW

331.50; $C_{18}H_{21}NOS_2$; ^1H NMR (CDCl$_3$): 7.03-7.15 (6H, m), 6.93-6.99 (2H, m), 6.74 (1H,

td, 7.3 Hz, 1.5 Hz), 4.31 (1H, d, 7.8 Hz), 3.95 (1H, br. d, 12.1 Hz), 3.83 (1H, td, 8.1 Hz,

10   3.8 Hz), 3.59 (1H, td, 11.1 Hz, 2.8 Hz), 2.82 (1H, td, 12.1 Hz, 3.3 Hz), 2.61-2.75 (3H, m),

2.35 (3H, s), 1.73 (1H, br. s). After separation by chiral chromatography the oil was

converted into its hydrochloride salt in which the pale yellow oil was taken up in

isopropanol (~200 ml) and filtered. Addition of hydrogen chloride (19 ml of a 1M

solution in diethyl ether, 19 mmol) gave a white precipitate to which further diethyl ether

15   (~50 ml) was added. The solid was isolated by filtration, washed with diethyl ether give

the hydrochloride salt of the title product as a white solid (3.03 g); MW 367.96;

$C_{18}H_{22}ClNOS_2$; ^1H NMR (CDCl$_3$): 9.94 (2H, br. s), 7.06-7.18 (6H, m), 6.94-7.03 (2H, m),

6.78 (1H, t, 6.8 Hz), 4.24-4.32 (1H, m), 4.20 (1H, d, 5.8 Hz), 3.89-4.06 (2H, m), 3.18

(2H, br. t, 11.9 Hz), 2.99 (2H, br. s), 2.37 (3H, s); LCMS (10 minutes method): m/z 332

20   [M-Cl]+ @ Rt 5.07 min.

EXAMPLE 12

(2R)-2-((R)-[4-chlorophenyl]{[2-methoxyphenyl]thio}methyl)morpholine hydrochloride

-46-

i)

Diastereomer 1
A solution of lithium diisopropylamide (2M in heptane, 18.2ml) was added

dropwise over 20min to a stirred solution of 4-benzyl-morpholin-3-one (5.0g, 26mmol)

5   and 4-chlorobenzaldehyde (4.41g, 31.4mmol) in dried tetrahydrofuran (60ml) cooled to –

70°C under nitrogen atmosphere. After 1h at –70°C, the reaction mixture was quenched

with aqueous ammonium chloride (100ml) and extracted with ethyl acetate (100ml). The

extracts were washed with 2M aqueous hydrochloric acid (100ml), brine solution (100ml)

and dried over sodium sulphate. After filtration, the solution was evaporated and the

10   residual oil purified by chromatography on silica eluting with ethyl acetate:hexane 70:30

then ethyl acetate to give diastereomer 1 (2R)-2-[(S)-(4-chlorophenyl)(hydroxy)methyl]-

4-benzylmorpholin-3-one and (2S)-2-[(R)-(4-chlorophenyl)(hydroxy)methyl]-4-

benzylmorpholin-3-one as a solid (2.64g) followed by diastereomer 2 (2R)-2-[(R)-(4-

chlorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one and (2S)-2-[(S)-(4-

15   chlorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one as an oil (1.46g). Diastereomer

1 was recrystallised from ethyl acetate (25ml) n-hexane (100ml) to give white needles

(2.47g, 29%)

ii)

20
A solution of borane in tetrahydrofuran (1M, 29ml) was added dropwise to a

stirred solution of diastereomer 1 (2R)-2-[(S)-(4-chlorophenyl)(hydroxy)methyl]-4-

−47−

benzylmorpholin-3-one and (2S)-2-[(R)-(4-chlorophenyl)(hydroxy)methyl]-4-

benzylmorpholin-3-one (2.40g 7.24mmol) in dried tetrahydrofuran (30ml) at room

temperature under nitrogen causing effervesence. The solution was heated to 60°C for 2h,

allowed to cool to room temperature and excess borane quenched by adding methanol

5   (14ml) slowly. Aqueous hydrochloric acid (1M, 14ml) was added, heated to 60°C for 1h

and then evaporated to a white solid. Added saturated aqueous sodium carbonate (50ml)

and diethyl ether (50ml) to dissolve the solid and extracted with diethyl ether (2x 50ml).

The extracts were washed with brine solution, dried, filtered and evaporated to a

colourless oil (2.38g). The oil was purified by chromatography on silica eluting with

10   diethyl ether:hexane 75:25 to give (R)-[4-chlorophenyl][(2R)-4-benzylmorpholin-2-

yl]methanol and (S)-[4-chlorophenyl][(2S)-4-benzylmorpholin-2-yl]methanol as a

colourless oil (2.08g)

iii)

15
A solution of carbon tetrabromide (2.82g, 8.5mmol) in dichloromethane (3ml)

was added dropwise over 10min to a stirred solution of (R)-[4-chlorophenyl][(2R)-4-

benzylmorpholin-2-yl]methanol and (S)-[4-chlorophenyl][(2S)-4-benzylmorpholin-2-

yl]methanol (1.80g, 5.67mmol) and triphenylphosphine (2.23g, 8.5mmol) in

20   dichloromethane (40ml) at room temperature under nitrogen. After 30min, the reaction

solution was washed with saturated aqueous sodium bicarbonate (50ml). The

dichloromethane layer was dried, filtered and evaporated to a red liquid (8.5g).

Trituration with diethyl ether (20ml) crystallised triphenylphoshine oxide that was then

removed by filtration. The filtrate was evaporated to a yellow oil and was purified by

25   chromatography on silica eluting with ethyl acetate:hexane 20:80 to give a colourless oil

of (2R)-2-[(S)-bromo(4-chlorophenyl)methyl]-4-benzylmorpholine and (2S)-2-[(R)-

-48-

bromo(4-chlorophenyl)methyl]-4-benzylmorpholine (1.17g) that crystallised to a pink
solid on standing.

iv)
5

Cesium carbonate (667mg, 2.05mmol) was added to a stirred solution of (2R)-2-
[(S)-bromo(4-chlorophenyl)methyl]-4-benzylmorpholine and (2S)-2-[(R)-bromo(4-
chlorophenyl)methyl]-4-benzylmorpholine (651mg, 1.71mmol) and 2-
methoxybenzenethiol (287mg, 2.05mmol) in dry dimethylformamide (3ml). The

10   suspension was heated to 90°C for 1h. The cooled reaction mixture was diluted with iced
water, 2M aqueous sodium hydroxide (1ml) and extracted with diethyl ether (15ml). The
extracts were washed with brine solution, dried, filtered and evaporated to a yellow oil
(0.89g). The crude product was purified by chromatography on silica eluting with ethyl
acetate:heptane 1:4 to give 2(R)-2-((R)-[4-chlorophenyl]{[2-

15   methoxyphenyl]thio}methyl)-4-benzylmorpholine and 2(S)-2-((S)-[4-chlorophenyl]{[2-
methoxyphenyl]thio}methyl)-4-benzylmorpholine as a pale yellow oil (619mg, 82%)

v)
Alpha-chloroethyl chloroformate (0.3ml, 2.78mmol) was added to a gently stirred

20   suspension of polystyrene supported diisopropylethylamine (Argonaut, 390mg,
1.39mmol) and 2(R)-2-((R)-[4-chlorophenyl]{[2-methoxyphenyl]thio}methyl)-4-

−49−

benzylmorpholine and 2(S)-2-((S)-[4-chlorophenyl]{[2-methoxyphenyl]thio}methyl)-4-benzylmorpholine (610mg, 1.39mmol) in dichloromethane (8ml) at room temperature under nitrogen. After 3h, the suspension was filtered and the filtrate evaporated. The residue was dissolved in methanol (10ml) and heated to 60°C for 1h. The solution was

5   evaporated and the solid residue crystallised from isopropanol (5ml) diethyl ether (10ml) to give a white solid (441mg, 82%). The racemic hydrochloride salt was converted to the free base by stirring in dicloromethane (20ml) and aqueous sodium hydroxide (1M, 20ml). The dichloromethane layer was separated, dried, filtered and evaporated to a colourless oil (403mg). Chiral preparative chromatography (Chiralcel-OD,

10   heptane:ethanol:dimethylethylamine 50:50:0.2) was used to isolate the first eluting enantiomer Rt 9.3min as an oil. This was redissolved in diethylether and treated with ethereal hydrogen chloride to give the title product (2R)-2-((R)-[4-chlorophenyl]{[2-methoxyphenyl]thio}methyl)morpholine hydrochloride as a solid (159mg, 36%, mp 238-241°C), NMR (DMSO) 9.31 (2H, br. s), 7.32 (4H, dd), 7.07-7.20 (2H, m), 6.91 (1H,d),

15   6.76 (1H,t), 4.67 (1H, d), 4.0-4.1 (2H, br d), 3.78 (3H, s), 3.72 (1H, t), 3.15 (1H, d), 2.95-3.1 (3H, m) LCMS: m/z 350 $[M+H]^+$ @ Rt 3.8 min

EXAMPLE 13
(2R)-2-((R)-[3-fluorophenyl]{[2-methoxyphenyl]thio}methyl)morpholine
20   hydrochloride
-50-

i)
A solution of lithium diisopropylamide (2M in heptane, 16.9ml) was added dropwise
over 15min to a stirred solution of 4-benzyl-morpholin-3-one (5.0g, 26mmol) and 3-

5   fluorobenzaldehyde (3.55g, 28.6mmol) in dried tetrahydrofuran (60ml) cooled to –70°C
under nitrogen atmosphere. After 1h at –70°C, the reaction mixture was quenched with
aqueous ammonium chloride (100ml) and extracted with ethyl acetate (100ml). The
extracts were washed with 2M aqueous hydrochloric acid (2x 50ml), brine solution
(100ml) and dried over sodium sulphate. After filtration, the solution was evaporated and

10   the residual oil purified by chromatography on silica eluting with ethyl acetate:hexane
70:30 then ethyl acetate to give diastereomer 1 (2R)-2-[(S)-(3-
fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one and (2S)-2-[(R)-(3-
fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one as a solid (3.8g) followed by
diastereomer 2 (2R)-2-[(R)-(3-fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one

15   and (2S)-2-[(S)-(3-fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one as an oil
(2.13g). Diastereomer 1 was recrystallised from ethyl acetate (25ml) n-hexane (100ml) to
give white needles (2.62g, 32%).

ii)

20
A solution of borane in tetrahydrofuran (1M, 30.7ml) was added dropwise to a
stirred solution of diastereomer 1 (2R)-2-[(S)-(3-fluorophenyl)(hydroxy)methyl]-4-

benzylmorpholin-3-one and (2S)-2-[(R)-(3-fluorophenyl)(hydroxy)methyl]-4-

benzylmorpholin-3-one (2.42g 7.68mmol) in dried tetrahydrofuran (30ml) at room

temperature under nitrogen causing effervesence. The solution was heated to 60°C for 2h,

allowed to cool to room temperature and excess borane quenched by adding methanol

5   (15ml) slowly. Aqueous hydrochloric acid (1M, 15ml) was added, heated to 60°C for 1h

and then evaporated to a white solid. Added saturated aqueous sodium carbonate (50ml)

and diethyl ether (50ml) to dissolve the solid and extracted with diethyl ether (2x 50ml).

The extracts were washed with brine solution, dried, filtered and evaporated to a

colourless oil (2.38g). The oil was purified by chromatography on silica eluting with

10   diethyl ether:hexane 75:25 to give (R)-[3-fluorophenyl][(2R)-4-benzylmorpholin-2-

yl]methanol and (S)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methanol as a

colourless oil (2.23g)

iii)

15
A solution of carbon tetrabromide (3.3g, 9.96mmol) in dichloromethane (4ml)

was added dropwise over 5min to a stirred solution of (R)-[3-fluorophenyl][(2R)-4-

benzylmorpholin-2-yl]methanol and (S)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-

yl]methanol (2.0g, 6.64mmol) and triphenylphosphine (2.61g, 9.96mmol) in

20   dichloromethane (40ml) at room temperature under nitrogen. After 30min, the reaction

solution was washed with saturated aqueous sodium bicarbonate (50ml). The

dichloromethane layer was dried, filtered and evaporated to a red liquid (8.5g).

Trituration with diethyl ether (40ml) crystallised triphenylphoshine oxide that was then

removed by filtration. The filtrate was evaporated to a yellow oil and was purified by

25   chromatography on silica eluting with ethyl acetate:hexane 20:80 to give a colourless oil

of (2R)-2-[(S)-bromo(3-fluorophenyl)methyl]-4-benzylmorpholine and (2S)-2-[(R)-

bromo(3-fluorophenyl)methyl]-4-benzylmorpholine (0.811g, 34%).

-52-

iv)
Cesium carbonate (546mg, 1.68mmol) was added to a stirred solution of (2R)-2-
[(S)-bromo(3-fluorophenyl)methyl]-4-benzylmorpholine and (2S)-2-[(R)-bromo(3-
fluorophenyl)methyl]-4-benzylmorpholine (510mg, 1.4mmol) and 2-
methoxybenzenethiol (235mg, 1.68mmol) in dry dimethylformamide (3ml). The
suspension was stirred at room temperature for 4h. The reaction mixture was diluted with
iced water, 2M aqueous sodium hydroxide (1ml) and extracted with diethyl ether (15ml).
The extracts were washed with brine solution, dried, filtered and evaporated to a yellow
oil (627mg). The crude product was purified by chromatography on silica eluting with
ethyl acetate:heptane 20:80 to give 2(R)-2-((R)-[3-fluorophenyl]{[2-
methoxyphenyl]thio}methyl)-4-benzylmorpholine and 2(S)-2-((S)-[3-fluorophenyl]{[2-
methoxyphenyl]thio}methyl)-4-benzylmorpholine as a pale yellow oil (466mg, 79%)

v)
Alpha-chloroethyl chloroformate (0.235ml, 2.17mmol) was added to a gently
stirred suspension of polystyrene supported diisopropylethylamine (Argonaut, 306mg,
1.09mmol) and 2(R)-2-((R)-[3-fluorophenyl]{[2-methoxyphenyl]thio}methyl)-4-

−53−

benzylmorpholine and 2(S)-2-((S)-[3-fluorophenyl]{[2-methoxyphenyl]thio}methyl)-4-

benzylmorpholine (460mg, 1.09mmol) in dichloromethane (6ml) at room temperature

under nitrogen. After 16h, the suspension was filtered and the filtrate evaporated. The

residue was dissolved in methanol (6ml) and heated to 60°C for 1h. The solution was

5   evaporated and the solid residue crystallised from isopropanol (15ml) and n-hexane to

give a white solid (371mg, 92%). The racemic hydrochloride salt was converted to the

free base by stirring in dicloromethane (20ml) and aqueous sodium hydroxide (0.5M,

20ml). The dichloromethane layer was separated, dried, filtered and evaporated to a

colourless oil (341mg). Chiral preparative chromatography (Chiralcel-OD,

10   heptane:ethanol:dimethylethylamine 50:50:0.2) was used to isolate the first eluting

enantiomer Rt 9.2min as an oil. This was redissolved in diethylether and treated with

ethereal hydrogen chloride to give the title product (2R)-2-((R)-[3-fluorophenyl]{[2-

methoxyphenyl]thio}methyl)morpholine hydrochloride as a solid (138mg, 34%, mp 233-

234°C). NMR (DMSO) 9.26 (2H, br. s), 7.31 (1H, q), 7.10-7.20 (4H, m), 7.05 (1H, t),

15   6.92 (1H,d), 6.78 (1H, t), 4.66 (1H, d), 4.0-4.15 (2H, m), 3.77 (3H, s), 3.72 (1H, t), 3.19

EXAMPLE 14:

(2R)-2-((R)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)morpholine

20   **hydrochloride**
Method 1

i)

-54-

A solution of borane in tetrahydrofuran (1M, 25.2ml) was added dropwise to a stirred solution of diastereomer 2 from example 13(i) (2R)-2-[(R)-(3-fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one and (2S)-2-[(S)-(3-

5   fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one (2.0g 6.3mmol) in dried tetrahydrofuran (25ml) at room temperature under nitrogen causing effervesence. The solution was heated to 60°C for 1.5h, allowed to cool to room temperature and excess borane quenched by adding methanol (10ml) slowly. Aqueous hydrochloric acid (1M, 13ml) was added, heated to 60°C for 1h and then evaporated to a white solid. Added

10   saturated aqueous sodium carbonate (50ml) and diethyl ether (50ml) to dissolve the solid and extracted with diethyl ether (2x 50ml). The extracts were washed with brine solution, dried, filtered and evaporated to a colourless oil (2.01g). The oil was dissolved in isopropanol (20ml) and ethereal hydrogen chloride (2M, 3ml) added to crystallise the salt (R)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methanol hydrochloride and (S)-[3-

15   fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methanol hydrochloride as a white solid (1.66g, 78%)

ii)
20   Methanesulphonyl chloride (1.01g, 8.9mmol) was added dropwise over 5min to a stirred solution of (R)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methanol

-55-

hydrochloride and (S)-[3-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methanol

hydrochloride (1.50g, 4.44mmol) and triethylamine (1.79g, 17.8mmol) in dry

dichloromethane (30ml) at room temperature under nitrogen atmosphere. After 1h, water

(30ml) was added, stirred vigorously and then the dichloromethane layer separated. The

5   solution was dried over sodium sulphate, filtered and evaporated to a colourless oil. The

oil was purified by chromatography on silica eluting with diethyl ether:hexane 3:1 to give

(R)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methyl methanesulphonate and (S)-[3-

fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methyl methanesulphonate as a colourless oil

(1.51g, 90%)

10

iii)
Anhydrous potassium carbonate (276mg, 2mmol) was added to a stirred solution

of (R)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methyl methanesulphonate and

(S)-[3-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methyl methanesulphonate (682mg,

15   1.8mmol) and 2-ethoxybenzenethiol (308mg, 2mmol) in dry dimethylformamide (13ml)

at room temperature under nitrogen atmosphere. After 3 days, water (25ml) was added

and the mixture extracted with diethyl ether (25ml). The extracts were washed with brine

solution (20ml), dried, filtered and evaporated to a yellow oil (0.89g). The product was

purified by chromatography on silica eluting with ethyl acetate:heptane 20:80 to give

20   2(R)-2-((R)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)-4-benzylmorpholine and

2(S)-2-((S)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)-4-benzylmorpholine as a

colourless oil (493mg, 63%).

25

iv)

Debenzylation of 2(R)-2-((R)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)-4-
benzylmorpholine and 2(S)-2-((S)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)-4-

5   benzylmorpholine (480mg, 1.1mmol) using the method described in example 13(v) gave
the racemic hydrochloride salt (360mg, 85%). After conversion to the free base, chiral
preparative chromatography (Chiralcel-OD, heptane:ethanol:dimethylethylamine
80:20:0.2) was used to isolate the first eluting enantiomer Rt 14.9min as an oil. This was
redissolved in diethylether and treated with ethereal hydrogen chloride to give the title

10   product (2R)-2-((R)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)morpholine
hydrochloride as a solid (144mg, 34%, mp 211-215°C). NMR (DMSO) 9.30 (2H, br. s),
7.31 (1H, q), 7.11-7.20 (4H, m), 7.05 (1H, t), 6.91 (1H,d), 6.79 (1H, t), 4.64 (1H, d), 3.97-
4.15 (4H, m), 3.72 (1H, t), 3.19 (1H, d), 2.92-3.1 (3H, m), 1.37 (3H, t). LCMS: *m/z* 348
[M+H]$^+$ @ Rt 4.1 min

15

Method 2

i)
A solution of 3-fluorophenylmagnesium bromide (0.5M, 50ml, 25mmol) was
added dropwise to a stirred solution of 4-benzyl-mopholin-2-carbonitrile (4.59g,

20   22.7mmol) in diethyl ether (50ml) at 0°C under nitrogen. After 45min at 0 C the mixture

-57-

was allowed to warm to room temperature for 30min then recooled and quenched by the addition of aqueous hydrochloric acid (5M, 40ml) –caution exothermic. After 30min at room temperature, the acidic mixture was basified with sodium hydroxide (5M, 60ml) and extracted with ethyl acetate (3x 150ml). The combined extracts were washed with

5   brine solution, dried, filtered and concentrated in vacuo to give (+/-)-(4-benzyl-morpholin-2-yl)-(3-fluorophenyl)methanone (6.9g) as a yellow oil.

ii)
10

Borontrifluoride etherate (27.6g, 194mmol) followed by trifluoroacetic acid (40ml) were added to a stirred solution of (+/-)-(4-benzyl-morpholin-2-yl)-(3-fluorophenyl)methanone (23.28g,77mmol) and triphenylsilane (81.1g, 311mmol) in dichloromethane (1000ml) at 0°C under nitrogen. After 16h at room temperature, reaction

15   mixture was cooled and carefully basified by addition of aqueous sodium bicarbonate. The organic layer was separated, dried and concentrated in vacuo. The residual orange oil was purified using SCX-2 resin to absorb the amine product. Elution with methanolic ammonia (2M) and concentration in vacuo gave an oil (30g) that was further purified by chromatography on silica (toluene:diethyl ether 60:40) to give (R)-[3-fluorophenyl][(2S)-

20   4-benzylmorpholin-2-yl]methanol and (S)-[3-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methanol as an oil (19.7g, 84%).

iii)
-58-

Convertion of (R)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methanol and (S)-[3-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methanol (19.7g) using method 1 in example 14(ii) gave (R)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methyl methanesulphonate and (S)-[3-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methyl
5   methanesulphonate (24.7g) was followed by method 1 in example 14(iii) to give 2(R)-2-((R)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)-4-benzylmorpholine and 2(S)-2-((S)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)-4-benzylmorpholine (22.5g). This was debenzylated by method 1 in example 14(iv) to give (2R)-2-((R)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)morpholine and (2S)-2-((S)-[3-

10   fluorophenyl]{[2-ethoxyphenyl]thio}methyl)morpholine (15.2g) followed by preparative chiral chromatography to separate the first eluting enantiomer (7.7g) and then salt formation to the title product (2R)-2-((R)-[3-fluorophenyl]{[2-ethoxyphenyl]thio}methyl)morpholine hydrochloride (4.38g) as a white crystalline solid.

15   **EXAMPLE 15**

(2R)-2-((R)-[3-fluorophenyl]{[2-chlorophenyl]thio}methyl)morpholine hydrochloride

i)
Anhydrous potassium carbonate (377mg, 2.73mmol) was added to a stirred solution of (R)-[3-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methyl methanesulphonate and (S)-[3-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methyl methanesulphonate

5   (740mg, 1.8mmol) and 2-chlorobenzenethiol (393mg, 2.73mmol) in dry dimethylformamide (10ml) at room temperature under nitrogen atmosphere. After 44h, diluted with methanol (15ml) and the inorganic solid filtered. The filtrate was poured directly onto SCX-2 columns (3x 10g), washed with methanol and the basic product eluted with methanolic ammonia (2M) to give a yellow oil (707mg) after evaporation.

10   The product was further purified by chromatography on silica eluting with ethyl acetate:heptane 20:80 to give 2(R)-2-((R)-[3-fluorophenyl]{[2-chlorophenyl]thio}methyl)-4-benzylmorpholine and 2(S)-2-((S)-[3-fluorophenyl]{[2-chlorophenyl]thio}methyl)-4-benzylmorpholine as a colourless oil (653mg, 78%).

15   ii)
Alpha-chloroethyl chloroformate (0.33ml, 3.06mmol) was added to a gently stirred suspension of polystyrene supported diisopropylethylamine (Argonaut, 429mg, 1.53mmol) and 2(R)-2-((R)-[3-fluorophenyl]{[2-chlorophenyl]thio}methyl)-4-

20   benzylmorpholine and 2(S)-2-((S)-[3-fluorophenyl]{[2-chlorophenyl]thio}methyl)-4-benzylmorpholine (429mg, 1.53mmol) in dichloromethane (10ml) at room temperature under nitrogen. After 2h, the suspension was filtered and the filtrate evaporated. The residue was dissolved in methanol (10ml) and heated to 60°C for 1h. The solution was evaporated to the hydrochloride salt, redissolved in methanol and converted to the free

25   base using SCX-2 column (10g) eluting with methanol and then methanolic ammonia (2M) to give a colourless oil (501mg, 97%). Chiral preparative chromatography

-60-

(Chiralcel-OJ, heptane:isopropanol:dimethylethylamine 90:10:0.2) was used to isolate the first eluting enantiomer Rt 19.2min as an oil. This was redissolved in diethylether and treated with ethereal hydrogen chloride to give the title product (2R)-2-((R)-[3-fluorophenyl]{[2-chlorophenyl]thio}methyl)morpholine hydrochloride as a solid (231mg,

5   40%, mp 183-7°C). NMR (DMSO) 9.38 (2H, br. s), 7.15-7.47 (7H, m), 7.09 (1H, t), 4.85 (1H, d), 4.12-4.20 (1H, m), 4.08 (1H, d), 3.77 (1H, t), 3.20 (1H, d), 2.95-3.10 (3H, m). LCMS: *m/z* 338/340 [M+H]$^+$ @ Rt 3.9 min

EXAMPLE 16

10   **(2R)-2-[(R)-(2-chloro-6-methylphenyl)thio](phenyl)methyl]morpholine hydrochloride**

i)
15   To a solution of (2R)-4-benzyl-2 [(S)-bromo(phenyl)methyl]morpholine (200 mg, 0.6 mmol) and 2-chloro-6-methyl thiophenol (0.167ml, 6eq) in anhydrous DMF (5 ml) at room temperature under nitrogen was added potassium carbonate (100 mg, 0.7mmol, 1.2eq). The reaction mixture was stirred at room temperature for 5 hours. The reaction mixture was diluted with methanol and poured directly onto a SCX-2 column for

20   purification to give (2R)-2-[(R)-(2-chloro-6-methylphenyl)thio](phenyl)methyl]-4-(phenyl)methyl]morpholine before taking directly onto the next step.

ii)   *(2R)-2-[(R)-(2-chloro-6 methylphenyl)thio](phenyl)methyl]morpholine hydrochloride* .

-61-
To a suspension of polymer supported Hunig's base (182mg, 3eq) and (2R)-2-
[(R)-(2-chloro-6 methylphenyl)thio](phenyl)methyl]-4-(phenyl)methyl]morpholine
(254mg, 0.6mmol) in dry DCM (5 ml) was added α-chloroethyl chloroformate (0.187ml,

5   1.7mmol, 3 eq) at room temperature and under nitrogen. The mixture was allowed to stir
at room temperature overnight. The reaction mixture was taken up in methanol (5 ml) and
stirred at room temperature overnight. The reaction mixture was then treated with SCX-2
(10 g). After elution with methanol followed by elution with 7 N NH$_3$/methanol (2R)-2-
[(R)-(2-chloro-6 methylphenyl)thio](phenyl)methyl]morpholine was obtained as an oil

10   (163 mg, 82% yield); MW 333; C$_{18}$H$_{20}$ClNOS; ^{1}H NMR (DMSO): 8.80 (1H, br s), 7.30
(1H, m), 7.20 (7H, m), 4.40 (1H, d, 8.2 Hz), 4.20 (1H, m), 4.00 (1H, m), 3.80 (1H, m),
3.15 (1H, m), 2.90 (2H, m), 2.20 (3H, s) 1.20 (1H, m); LCMS (10 minutes method): *m/z*
334[M+H]$^+$ @ R$_T$ 5.1 min; HPLC purity = 100% (UV$_{215nm}$) / 100% (ELS). The free base
was converted into the title product HCl salt.

15

EXAMPLE 17:
(2R)-2-((R)-[4-fluorophenyl]{2-methoxyphenyl]thio}methyl)morpholine hydrochloride
i)

-62-

Diastereomer 1
Following the procedure described in example 5(i), 4-benzylmorpholin-3-one (4.06g) was converted to 2-(R)-2-[(S)-(4-fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one and 2-(S)-2-[(R)-(4-fluorophenyl)(hydroxy)methyl]-4-

5   benzylmorpholin-3-one. Crystallised from hexane-ethyl acetate to give a colourless solid (2.04g).

ii)
10   2-(R)-2-[(S)-(4-fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one and 2-(S)-2-[(R)-(4-fluorophenyl)(hydroxy)methyl]-4-benzylmorpholin-3-one (2.0g) was converted to (R)-[4-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methanol and (S)-[4-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methanol following procedure described in example 2(ii) to give a colourless oil (1.88g).

15

iii)
-63-

To a stirred solution of (R)-[4-fluorophenyl][(2R)-4-benzylmorpholin-2-yl]methanol and (S)-[4-fluorophenyl][(2S)-4-benzylmorpholin-2-yl]methanol (1.64g, 5.54mmol)) and triphenylphosphine (2.32g, 8.86mmol) in anhydrous chloroform (40ml)

5   was added solid carbon tetrabromide (2.76g, 8.31mmol) in one lot. The solution was heated at reflux under nitrogen for 3h. Cooled and washed reaction mixture with brine, dried, filtered and evaporated to a red oil. The oil was purified by chromatography on silica eluting with hexane:ethyl acetate 41:9 to give 2(R)-2-[(S)-bromo(4-fluorophenyl)methyl]-4-benzylmorpholine and 2(S)-2-[(R)-bromo(4-

10   fluorophenyl)methyl]-4-benzylmorpholine as a colourless oil (0.49g)

iv)
To a stirred suspension of 2(R)-2-[(S)-bromo(4-fluorophenyl)methyl]-4-

15   benzylmorpholine and 2(S)-2-[(R)-bromo(4-fluorophenyl)methyl]-4-benzylmorpholine (0.6g, 1.65mmol) and cesium carbonate (0.59g, 1.81mmol) in dry DMF (5ml) was added 2-methoxybenzenethiol (0.25g, 1.81mmol). The suspension was heated at 90°C under nitrogen for 3h. The cooled reaction mixture was diluted with water and extracted with diethyl ether. The extracts were washed with water and brine, dried, filtered and

20   evaporated to an oil. The crude oil was purified by chromatography on silica eluting with hexane:ethyl acetate 4:1 then 3:2 to give (2R)-2-((R)-(4-fluorophenyl){[2-methoxyphenyl]thio}methyl)morpholine and (2S)-2-((S)-(4-fluorophenyl){[2-methoxyphenyl]thio}methyl)morpholine a colourless oil (0.22g)

-64-

v)
Reaction of the mixture of (2R)-2-((R)-(4-fluorophenyl){[2-methoxyphenyl]thio}methyl)morpholine and (2S)-2-((S)-(4-fluorophenyl){[2-methoxyphenyl]thio}methyl)morpholine (430 mg, 1.02 mmol) following procedure

5   described in EXAMPLE 1(iv) gave a colourless oil (340 mg, 90% yield) from which first eluting enantiomer (2R)-2-((R)-(4-fluorophenyl){[2-methoxyphenyl]thio}methyl)morpholine was obtained after chiral chromatography on a Chiralcel-OD column eluant heptane/isopropanol/dimethylethylamine (50/50/0.2): Rt 10.58 min. This was converted into its hydrochloride salt. ^{1}H NMR (CD$_3$OD): 7.01-7.20

10   (4H, m), 6.70-6.80 (3H, m), 6.60 (1H, t), 4.37 (1H, d,), 3.82-3.90 (1H, m), 3.70-3.79 (4H, m), 3.49-3.60 (1H, m), 2.70-2.78 (2H, m),.2.60-2.70 (2H, m).

The pharmacological profile of the present compounds may be demonstrated as follows. All of the exemplified compounds above have been found to exhibit a K$_i$ value

15   less than 100nM at the serotonin transporter and a K$_i$ value less than 100nM at the norepinephrine transporter as determined using the scintillation proximity assays described below. Furthermore, all of the exemplified compounds above have been found to selectively inhibit the serotonin and norepinephrine transporters relative to the dopamine transporter by a factor of at least five using the scintillation proximity assays as

20   described below.

Generation of stable cell-lines expressing the human dopamine, norepinephrine and serotonin transporters

Standard molecular cloning techniques were used to generate stable cell-lines

25   expressing the human dopamine, norepinephrine and serotonin transporters. The polymerase chain reaction (PCR) was used in order to isolate and amplify each of the

three full-length cDNAs from an appropriate cDNA library. Primers for PCR were designed using the following published sequence data:

Human dopamine transporter: GenBank M95167. Reference: Vandenbergh DJ, Persico AM and Uhl GR. *A human dopamine transporter cDNA predicts reduced*

5   *glycosylation, displays a novel repetitive element and provides racially-dimorphic TaqI RFLPs.* Molecular Brain Research (1992) volume 15, pages 161-166.

Human norepinephrine transporter: GenBank M65105. Reference: Pacholczyk T, Blakely, RD and Amara SG. *Expression cloning of a cocaine- and antidepressant-sensitive human noradrenaline transporter.* Nature (1991) volume 350, pages 350-354.

10   Human serotonin transporter: GenBank L05568. Reference: Ramamoorthy S, Bauman AL, Moore KR, Han H, Yang-Feng T, Chang AS, Ganapathy V and Blakely RD. *Antidepressant- and cocaine-sensitive human serotonin transporter: Molecular cloning, expression, and chromosomal localization.* Proceedings of the National Academy of Sciences of the USA (1993) volume 90, pages 2542-2546.

15   The PCR products were cloned into a mammalian expression vector (eg pcDNA3.1 (Invitrogen)) using standard ligation techniques. The constructs were then used to stably transfect HEK293 cells using a commercially available lipofection reagent (Lipofectamine™ – Invitrogen) following the manufacture's protocol.

20   Scintillation proximity assays for determining the affinity of test ligands at the norepinephrine and serotonin transporters.

The compounds of the present invention are norepinephrine and serotonin reuptake inhibitors, and possess excellent activity in, for example, a scintillation proximity assay (e.g. J. Gobel, D.L. Saussy and A. Goetz, J. Pharmacol. Toxicolo. (1999),

25   42, 237-244). Thus ^{3}H-nisoxetine binding to norepinephrine re-uptake sites in a cell line transfected with DNA encoding human norepinephrine transporter binding protein and similarly ^{3}H-citalopram binding to serotonin re-uptake sites in a cell line transfected with DNA encoding human serotonin transporter binding protein have been used to determine the affinity of ligands at the norepinephrine and serotonin transporters respectively.

30

Norepinephrine Binding Assay

Membrane Preparation:

-66-

Cell pastes from large scale production of HEK-293 cells expressing cloned human norepinephrine transporters were homogenized in 4 volumes 50mM Tris-HCl containing 300mM NaCl and 5mM KCl, pH 7.4. The homogenate was centrifuged twice (40,000g, 10min, 4°C) with pellet re-suspension in 4 volumes of Tris-HCl buffer

5   containing the above reagents after the first spin and 8 volumes after the second spin. The suspended homogenate was centrifuged (100g, 10min, 4°C) and the supernatant kept and re-centrifuged (40,000g, 20min, 4°C). The pellet was resuspended in Tris-HCl buffer containing the above reagents along with 10%w/v sucrose and 0.1mM phenylmethylsulfonyl fluoride (PMSF). The membrane preparation was stored in

10   aliquots (1ml) at –80°C until required. The protein concentration of the membrane preparation was determined using a bicinchoninic acid (BCA) protein assay reagent kit (available from Pierce).

[^{3}H]-Nisoxetine Binding Assay:

15   Each well of a 96 well microtitre plate was set up to contain the following:

50µl   2nM [N-methyl-^{3}H]-Nisoxetine hydrochloride (70-87Ci/mmol, from NEN Life
         Science Products)

75µl   Assay buffer (50mM Tris-HCl pH 7.4 containing 300mM NaCl and 5mM KCl)

25µl   Test compound, assay buffer (total binding) or 10µM Desipramine HCl (non-

20   specific binding)

50µl   Wheatgerm agglutinin coated poly (vinyltoluene) (WGA PVT) SPA Beads
         (Amersham Biosciences RPNQ0001) (10mg/ml)

50µl   Membrane (0.2mg protein per ml)

      The microtitre plates were incubated at room temperature for 10 hours prior to

25   reading in a Trilux scintillation counter. The results were analysed using an automatic spline fitting programme (Multicalc, Packard, Milton Keynes, UK) to provide Ki values for each of the test compounds.

Serotonin Binding Assay

30   The ability of a test compound to compete with [^{3}H]-citalopram for its binding sites on cloned human serotonin transporter containing membranes has been used as a

-67-

measure of test compound ability to block serotonin uptake via its specific transporter (Ramamoorthy, S., Giovanetti, E., Qian, Y., Blakely, R., (1998) J. Biol. Chem. 273, 2458).

5   Membrane Preparation:

Membrane preparation is essentially similar to that for the norepinephrine transporter containing membranes as described above. The membrane preparation was stored in aliquots (1ml) at –70°C until required. The protein concentration of the membrane preparation was determined using a BCA protein assay reagent kit.

10

$[^3H]$-Citalopram Binding Assay:

Each well of a 96 well microtitre plate was set up to contain the following:

50µl   2nM $[^3H]$-Citalopram (60-86Ci/mmol, Amersham Biosciences)

75µl   Assay buffer (50mM Tris-HCl pH 7.4 containing 150mM NaCl and 5mM KCl)

15   25µl   Diluted compound, assay buffer (total binding) or 100µM Fluoxetine (non-specific binding)

50µl   WGA PVT SPA Beads (40mg/ml)

50µl   Membrane preparation (0.4mg protein per ml)

The microtitre plates were incubated at room temperature for 10 hours prior to

20   reading in a Trilux scintillation counter. The results were analysed using an automatic spline fitting programme (Multicalc, Packard, Milton Keynes, UK) to provide Ki (nM) values for each of the unknown compounds.

Dopamine Binding Assay

25   The ability of a test compound to compete with $[^3H]$-WIN35,428 for its binding sites on human cell membranes containing cloned human dopamine transporter has been used as a measure of the ability of such test compounds to block dopamine uptake via its specific transporter (Ramamoorthy et al 1998 *supra*).

30   Membrane Preparation:

-68-

Is essentially the same as for membranes containing cloned human serotonin transporter as described above.

[^{3}H]-WIN35,428 Binding Assay:

5   Each well of a 96well microtitre plate was set up to contain the following:

50µl   4nM [^{3}H]-WIN35,428 (84-87Ci/mmol, from NEN Life Science Products)

75µl   Assay buffer (50mM Tris-HCl pH 7.4 containing 150mM NaCl and 5mM KCl)

25µl   Diluted compound, assay buffer (total binding) or 100µM Nomifensine (non-specific binding)

10   50µl   WGA PVT SPA Beads (10mg/ml)

50µl   Membrane preparation (0.2mg protein per ml.)

The microtitre plates were incubated at room temperature for 120 minutes prior to reading in a Trilux scintillation counter. The results were analysed using an automatic spline fitting programme (Multicalc, Packard, Milton Keynes, UK) to provide Ki values

15   for each of the unknown compounds.

Formalin Paw Assay

The analgesic effect of compounds of the invention for the treatment of persistent nociceptive pain was demonstrated using the well-known "formalin test." The formalin

20   test is a model of persistent nociceptive activation induced by tissue injury which can lead to central sensitization. (Shibata, M., Ohkubo, T., Takahashi, H., and Inoki, R., "Modified formalin test: Characteristic biphasic pain response," *Pain* (1989) **38**: 347-352; and Tjolsen, A., Berge, O.G., Hunskaar, S., Rosland, J.H., and Hole, K., "The formalin test: an evaluation of the method," *Pain* (1992) 51:5-17.) The effect of compounds of the

25   invention on formalin-induced paw-licking behavior in the rat was investigated as an index of persistent nociceptive activation. In this test, the injection of formalin under the skin on the dorsal lateral surface of the hind paw of rats causes an immediate and intense increase in the spontaneous activity of C fiber afferents. This activation evokes a distinctly quantifiable behavior indicative of pain, such as licking of the injected paw.

30   The behavioral response to formalin is biphasic, with an early phase that is short lived, followed by an extended tonic response or late phase of persistent nociceptive activation.

-69-

Mechanisms causing the late phase response, such as central sensitization of pain transmitting neurons, are currently believed to contribute to various types of persistent pains.

Male Sprague-Dawley rats (200-250g; Charles River, Portage, MI) were
5   maintained at constant temperature and light (12h light/12h dark) for 4-7 days prior to the studies. Animals had free access to food and water at all times prior to the day of the experiment.

The formalin test was performed in custom made Plexiglas® boxes 25x25x20 cm (length x width x height) in size. A mirror placed at the back of the box allowed the
10 unhindered observation of the formalin injected paw. Rats were acclimatized individually in the cubicles at least 1 hour prior to the experiment. All testing was conducted between 08:00 and 14:00 hr and the testing room temperature was maintained at 21-23 °C. Test compound was administered 30 or 60 minutes prior to the formalin injection. Formalin (50 μl of a 5% solution in saline) was injected subcutaneously into the dorsal lateral
15 surface of the right hind paw with a 27 gauge needle. Observation started immediately after the formalin injection. Formalin-induced pain was quantified by recording in 5 minute intervals the number of formalin injected paw licking events and the number of seconds each licking event lasted. These recordings were made for 50 minutes after the formalin injection. Scoring in the formalin test was performed according to Coderre *et al.*,
20 1993b and Abbott *et al.*, 1995. (Coderre T.J., Fundytus M.E., McKenna J.E., Dalal S. and Melzack R. "The formalin test: a validation of the weighted-scores method of the behavioral pain rating," *Pain*(1993b) **54**: 43-50; and Abbott F.V., Franklin K.B.J. and Westbrook R.F. "The formalin test: scoring properties of the first and second phases of the pain response in rats," *Pain* (1995) **60**: 91-102.) The sum of time spent licking in
25 seconds from time 0 to 5 minutes was considered the early phase while the late phase was taken as the sum of seconds spent licking from 15 to 40 minutes.

In Vitro Determination of the Interaction of compounds with CYP2D6 in Human Hepatic
Microsomes
30   Cytochrome P450 2D6 (CYP2D6) is a mammalian enzyme which is commonly associated with the metabolism of around 30% of pharmaceutical compounds. Moreover, this enzyme shows a genetic polymorphism with as a consequence a presence in the

-70-

population of poor and normal metabolizers. A low involvement of CYP2D6 in the
metabolism of compounds (i.e. the compound being a poor substrate of CYP2D6) is
desirable in order to reduce any variability from subject to subject in the
pharmacokinetics of the compound. Also, compounds with a low inhihibitor potential for
5   CYP2D6 are desirable in order to avoid drug-drug interactions with co-administered
drugs that are substrates of CYP2D6. Compounds may be tested both as substrates and as
inhibitors of this enzyme by means of the following assays.

CYP2D6 substrate assay

10   **Principle:**
       This assay determines the extent of the CYP2D6 enzyme involvement in the total
oxidative metabolism of a compound in microsomes. Preferred compounds of the present
invention exhibit less than 75% total metabolism via the CYP2D6 pathway.
       For this in vitro assay, the extent of oxidative metabolism in human liver
15   microsomes (HLM) is determined after a 30 minute incubation in the absence and
presence of Quinidine, a specific chemical inhibitor of CYP2D6. The difference in the
extent of metabolism in absence and presence of the inhibitor indicates the involvement
of CYP2D6 in the metabolism of the compound.

20   **Materials and Methods:**
       Human liver microsomes (mixture of 20 different donors, mixed gender) were
acquired from Human Biologics (Scottsdale, AZ, USA). Quinidine and β–NADPH
(β–Nicotinamide Adenine Dinucleotide Phosphate, reduced form, tetrasodium salt) were
purchased from Sigma (St Louis, MO, USA). All the other reagents and solvents were of
25   analytical grade. A stock solution of the new chemical entity (NCE) was prepared in a
mixture of Acetonitrile/Water to reach a final concentration of acetonitrile in the
incubation below 0.5%.
       The microsomal incubation mixture (total volume 0.1 mL) contained the NCE (4
μM), β–NADPH (1 mM), microsomal proteins (0.5 mg/mL), and Quinidine (0 or 2 μM)
30   in 100 mM sodium phosphate buffer pH 7.4. The mixture was incubated for 30 minutes at
37 °C in a shaking waterbath. The reaction was terminated by the addition of acetonitrile
(75 μL). The samples were vortexed and the denaturated proteins were removed by

-71-

centrifugation. The amount of NCE in the supernatant was analyzed by liquid chromatography /mass spectrometry (LC/MS) after addition of an internal standard. A sample was also taken at the start of the incubation (t=0), and analysed similarly.

Analysis of the NCE was performed by liquid chromatography /mass spectrometry. Ten μL of diluted samples (20 fold dilution in the mobile phase) were injected onto a Spherisorb CN Column, 5 μM and 2.1 mm x 100 mm (Waters corp. Milford, MA, USA). The mobile phase consisting of a mixture of Solvent A/Solvent B, 30/70 (v/v) was pumped (Alliance 2795, Waters corp. Milford, MA, USA) through the column at a flow rate of 0.2 ml/minute. Solvent A and Solvent B were a mixture of ammonium formate 5.10^{-3} M pH 4.5/ methanol in the proportions 95/5 (v/v) and 10/90 (v/v), for solvent A and solvent B, respectively. The NCE and the internal standard were quantified by monitoring their molecular ion using a mass spectrometer ZMD or ZQ (Waters-Micromass corp, Machester, UK) operated in a positive electrospray ionisation.

The extent of CYP2D6 involvement (% of CYP2D6 involvement) was calculated comparing the extent of metabolism in absence and in presence of quinidine in the incubation.

The extent of metabolism without inhibitor (%) was calculated as follows:

$$\frac{\text{(NCE response in samples without inhibitor)time 0 - (NCE response in samples without inhibitor)time 30}}{\text{(NCE response in samples without inhibitor)time 0}} \times 100$$

The extent of metabolism with inhibitor (%) was calculated as follows:

$$\frac{\text{(NCE response in samples without inhibitor)time 0 - (NCE response in samples with inhibitor)time 30}}{\text{(NCE response in samples without inhibitor)time 0}} \times 100$$

where the NCE response is the area of the NCE divided by the area of the internal standard in the LC/MS analysis chromatogram, time0 and time30 correspond to the 0 and 30 minutes incubation time.

The % of CYP2D6 involvement was calculated as follows:

$$\frac{\text{(% extent of metabolism without inhibitor) - (% extent of metabolism with inhibitor)}}{\text{% extent of metabolism without inhibitor}} \times 100$$

CYP2D6 inhibitor assay

-72-

Principle:

The CYP2D6 inhibitor assay evaluates the potential for a compound to inhibit CYP2D6. This is performed by the measurement of the inhibition of the bufuralol 1'-hydroxylase activity by the compound compared to a control. The 1'-hydroxylation of

5   bufuralol is a metabolic reaction specific to CYP2D6. Preferred compounds of the present invention exhibit an IC_{50} higher than 6 μM for CYP2D6 activity, the IC_{50} being the concentration of the compound that gives 50 % of inhibition of the CYP2D6 activity.

Material and methods:

10   Human liver microsomes (mixture of 20 different donors, mixed gender) were acquired from Human Biologics (Scottsdale, AZ). β–NADPH was purchased from Sigma (St Louis, MO). Bufuralol was purchased from Ultrafine (Manchester, UK). All the other reagents and solvents were of analytical grade.

Microsomal incubation mixture (total volume 0.1 mL) contained bufuralol 10 μM,

15   β–NADPH (2 mM), microsomal proteins (0.5 mg/mL), and the new chemical entity (NCE) (0, 5, and 25 μM) in 100 mM sodium phosphate buffer pH 7.4. The mixture was incubated in a shaking waterbath at 37 °C for 5 minutes. The reaction was terminated by the addition of methanol (75 μL). The samples were vortexed and the denaturated proteins were removed by centrifugation. The supernatant was analyzed by liquid

20   chromatography connected to a fluorescence detector. The formation of the 1'-hydroxybufuralol was monitored in control samples (0 μM NCE) and in the samples incubated in presence of the NCE. The stock solution of NCE was prepared in a mixture of Acetonitrile/Water to reach a final concentration of acetonitrile in the incubation below 1.0%.

25   The determination of 1'hydroxybufuralol in the samples was performed by liquid chromatograhy with fluorimetric detection as described below. Twenty five μL samples were injected onto a Chromolith Performance RP-18e column (100 mm x 4.6 mm) (Merck KGAa, Darmstadt, Germany). The mobile phase, consisting of a mixture of solvent A and solvent B whose the proportions changed according the following linear

30   gradient, was pumped through the column at a flow rate of 1 ml/min:

-73-

Time (minutes)	Solvent A (%)	Solvent B (%)
0	65	35
2.0	65	35
2.5	0	100
5.5	0	100
6.0	65	35

Solvent A and Solvent B consisted of a mixture of 0.02 M potassium dihydrogenophosphate buffer pH3/ methanol in the proportion 90/10 (v/v) for solvent A and 10/90 (v/v) for solvent B. The run time was 7.5 minutes. Formation of 1'-

5   hydroxybufuralol was monitored by fluorimetric detection with extinction at λ 252 nm and emission at λ 302 nm.

The IC_{50} of the NCE for CYP2D6 was calculated by the measurement of the percent of inhibition of the formation of the 1'-hydroxybufuralol in presence of the NCE compared to control samples (no NCE) at a known concentration of the NCE.

10   The percent of inhibition of the formation of the 1'-hydroxybufuralol is calculated as follows:

$$\frac{\text{(1'-hydroxybufuralol formed without inhibitor)} - \text{(1'-hydroxybufuralol formed with inhibitor)}}{\text{(1'-hydroxybufuralol area formed without inhibitor)}} \times 100$$

The IC_{50} is calculated from the percent inhibition of the formation of the 1'-hydroxybufuralol as follows (assuming competitive inhibition):

15    $$\frac{\text{NCE Concentration} \times (100 - \text{Percent of inhibition})}{\text{Percent of inhibition}}$$

The IC_{50} estimation is assumed valid if inhibition is between 20% and 80% (Moody GC, Griffin SJ, Mather AN, McGinnity DF, Riley RJ. 1999. Fully automated analysis of activities catalyzed by the major human liver cytochrome P450 (CYP) enzymes: assessment of human CYP inhibition potential. Xenobiotica, 29(1): 53-75).
